

Package ‘sits’

March 17, 2023

Type Package

Version 1.3.0

Title Satellite Image Time Series Analysis for Earth Observation Data Cubes

Maintainer Gilberto Camara <gilberto.camara.inpe@gmail.com>

Description An end-to-end toolkit for land use and land cover classification using big Earth observation data, based on machine learning methods applied to satellite image data cubes, as described in Simoes et al (2021) <doi:10.3390/rs13132428>. Builds regular data cubes from collections in AWS, Microsoft Planetary Computer, Brazil Data Cube, and Digital Earth Africa using the Spatio-temporal Asset Catalog (STAC) protocol (<<https://stacspec.org/>> and the 'gdalcubes' R package developed by Appel and Pebesma (2019) <doi:10.3390/data4030092>. Supports visualization methods for images and time series and smoothing filters for dealing with noisy time series. Includes functions for quality assessment of training samples using self-organized maps as presented by Santos et al (2021) <doi:10.1016/j.isprsjprs.2021.04.014>. Provides machine learning methods including support vector machines, random forests, extreme gradient boosting, multi-layer perceptrons, temporal convolutional neural networks proposed by Pelletier et al (2019) <doi:10.3390/rs11050523>, residual networks by Fawaz et al (2019) <doi:10.1007/s10618-019-00619-1>, and temporal attention encoders by Garnot and Landrieu (2020) <arXiv:2007.00586>. Performs efficient classification of big Earth observation data cubes and includes functions for post-classification smoothing based on Bayesian inference, and methods for uncertainty assessment. Enables best practices for estimating area and assessing accuracy of land change as recommended by Olofsson et al (2014) <doi:10.1016/j.rse.2014.02.015>. Minimum recommended requirements: 16 GB RAM and 4 CPU dual-core.

Description

Satellite Image Time Series Analysis for Earth Observation Data Cubes

Purpose

The SITS package provides a set of tools for analysis, visualization and classification of satellite image time series. It includes methods for filtering, clustering, classification, and post-processing.

cerrado_2classes	<i>Samples of classes Cerrado and Pasture</i>
------------------	-----------------------------------------------

Description

A dataset containing a tibble with time series samples for the Cerrado and Pasture areas of the Mato Grosso state. The time series come from MOD13Q1 collection 5 images.

Usage

```
data(cerrado_2classes)
```

Format

A tibble with 736 rows and 7 variables: longitude: East-west coordinate of the time series sample (WGS 84), latitude (North-south coordinate of the time series sample in WGS 84), start_date (initial date of the time series), end_date (final date of the time series), label (the class label associated to the sample), cube (the name of the cube associated with the data), time_series (list containing a tibble with the values of the time series).

plot	<i>Plot time series</i>
------	-------------------------

Description

This is a generic function. Parameters depend on the specific type of input. See each function description for the required parameters:

- sits tibble: see [plot.sits](#)
- patterns: see [plot.patterns](#)
- SOM map: see [plot.som_map](#)
- SOM evaluate cluster: see [plot.som_evaluate_cluster](#)
- classified time series: see [plot.predicted](#)
- raster cube: see [plot.raster_cube](#)
- random forest model: see [plot.rfor_model](#)
- xgboost model: see [plot.xgb_model](#)

- torch ML model: see [plot.torch_model](#)
- classification probabilities: see [plot.probs_cube](#)
- model uncertainty: see [plot.uncertainty_cube](#)
- classified image: see [plot.class_cube](#)

In the case of time series, the plot function produces different plots based on the input data:

- "all years": Plot all samples from the same location together
- "together": Plot all samples of the same band and label together

The `plot.sits` function makes an educated guess of what plot is required, based on the input data. If the input data has less than 30 samples, it will default to "all years". If there are more than 30 samples, it will default to "together".

Usage

```
## S3 method for class 'sits'  
plot(x, y, ...)
```

Arguments

x	Object of class "sits"
y	Ignored.
...	Further specifications for plot .

Value

A series of plot objects produced by `ggplot2` showing all time series associated to each combination of band and label, and including the median, and first and third quartile ranges.

Note

Please refer to the `sits` documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

```
if (sits_run_examples()) # plot sets of time series plot(cerrado_2classes)
```

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

plot.class_cube *Plot classified images*

Description

plots a classified raster using ggplot.

Usage

```
## S3 method for class 'class_cube'
plot(
  x,
  y,
  ...,
  tile = x$tile[[1]],
  title = "Classified Image",
  legend = NULL,
  palette = "Spectral"
)
```

Arguments

x	Object of class "class_cube".
y	Ignored.
...	Further specifications for plot .
tile	Tile to be plotted.
title	Title of the plot.
legend	Named vector that associates labels to colors.
palette	Alternative RColorBrewer palette

Value

A color map, where each pixel has the color associated to a label, as defined by the legend parameter.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
  # create a random forest model
  rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
```

```
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # classify a data cube
  probs_cube <- sits_classify(
    data = cube, ml_model = rfor_model, output_dir = tempdir()
  )
  # label cube with the most likely class
  label_cube <- sits_label_classification(
    probs_cube, output_dir = tempdir()
  )
  # plot the resulting classified image
  plot(label_cube)
}
```

plot.geo_distances *Make a kernel density plot of samples distances.*

Description

Make a kernel density plot of samples distances.

Usage

```
## S3 method for class 'geo_distances'
plot(x, y, ...)
```

Arguments

x	Object of class "geo_distances".
y	Ignored.
...	Further specifications for plot .

Value

A plot showing the sample-to-sample distances and sample-to-prediction distances.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Felipe Souza, <lipecaso@gmail.com>
Rolf Simoes, <rolf.simoes@inpe.br>
Alber Sanchez, <alber.ipia@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # read a shapefile for the state of Mato Grosso, Brazil  
  mt_shp <- system.file("extdata/shapefiles/mato_grosso/mt.shp",  
    package = "sits"  
  )  
  # convert to an sf object  
  mt_sf <- sf::read_sf(mt_shp)  
  # calculate sample-to-sample and sample-to-prediction distances  
  distances <- sits_geo_dist(samples_modis_ndvi, mt_sf)  
  # plot sample-to-sample and sample-to-prediction distances  
  plot(distances)  
}
```

plot.patterns

Plot patterns that describe classes

Description

Plots the patterns to be used for classification

Given a sits tibble with a set of patterns, plot them.

Usage

```
## S3 method for class 'patterns'  
plot(x, y, ...)
```

Arguments

x	Object of class "patterns".
y	Ignored.
...	Further specifications for plot .

Value

A plot object produced by ggplot2 with one average pattern per label.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples. This code is reused from the dtwSat package by Victor Maus.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Victor Maus, <vwmaus1@gmail.com>

Examples

```
if (sits_run_examples()) {  
  # plot patterns  
  plot(sits_patterns(cerrado_2classes))  
}
```

plot.predicted *Plot time series predictions*

Description

Given a sits tibble with a set of predictions, plot them

Usage

```
## S3 method for class 'predicted'  
plot(x, y, ..., bands = "NDVI", palette = "Harmonic")
```

Arguments

x	Object of class "predicted".
y	Ignored.
...	Further specifications for plot .
bands	Bands for visualization.
palette	HCL palette used for visualization in case classes are not in the default sits palette.

Value

A plot object produced by ggplot2 showing the time series and its label.

Note

Please refer to the sits documentation available in <<https://e-sensing.github.io/sitsbook/>> for detailed examples.

Author(s)

Victor Maus, <vwmaus1@gmail.com>

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```

if (sits_run_examples()) {
  # Retrieve the samples for Mato Grosso
  # train a tempCNN model
  ml_model <- sits_train(samples_modis_ndvi, ml_method = sits_tempcnn)
  # classify the point
  point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
  point_class <- sits_classify(
    data = point_ndvi, ml_model = ml_model
  )
  plot(point_class)
}

```

plot.probs_cube	<i>Plot probability cubes</i>
-----------------	-------------------------------

Description

plots a probability cube using stars

Usage

```

## S3 method for class 'probs_cube'
plot(
  x,
  ...,
  tile = x$tile[[1]],
  labels = NULL,
  palette = "YlGnBu",
  rev = FALSE
)

```

Arguments

x	Object of class "probs_image".
...	Further specifications for plot .
tile	Tile to be plotted.
labels	Labels to plot (optional).
palette	RColorBrewer palette
rev	Reverse order of colors in palette?

Value

A plot containing probabilities associated to each class for each pixel.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```

if (sits_run_examples()) {
  # create a random forest model
  rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # classify a data cube
  probs_cube <- sits_classify(
    data = cube, ml_model = rfor_model, output_dir = tempdir()
  )
  # plot the resulting probability cube
  plot(probs_cube)
}

```

plot.raster_cube

Plot RGB data cubes

Description

Plot RGB raster cube

Usage

```

## S3 method for class 'raster_cube'
plot(
  x,
  ...,
  band = NULL,
  red = NULL,
  green = NULL,
  blue = NULL,
  tile = x$tile[[1]],
  date = sits_timeline(x)[[1]],
  palette = "RdYlGn",
  rev = FALSE
)

```

Arguments

x	Object of class "raster_cube".
...	Further specifications for plot .
band	Band for plotting grey images.
red	Band for red color.
green	Band for green color.
blue	Band for blue color.
tile	Tile to be plotted.
date	Date to be plotted.
palette	An RColorBrewer palette
rev	Reverse the color order in the palette?

Value

A plot object with an RGB image or a B/W image on a color scale using the palette

Note

To see which color palettes are supported, please run

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # plot NDVI band of the second date date of the data cube
  plot(cube, band = "NDVI", date = sits_timeline(cube)[2])
}
```

plot.rfor_model	<i>Plot Random Forest model</i>
-----------------	---------------------------------

Description

Plots the important variables in a random forest model.

Usage

```
## S3 method for class 'rfor_model'  
plot(x, y, ...)
```

Arguments

x	Object of class "rf_model".
y	Ignored.
...	Further specifications for plot .

Value

A random forest object.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # Retrieve the samples for Mato Grosso  
  # train a random forest model  
  rf_model <- sits_train(samples_modis_ndvi, ml_method = sits_rfor())  
  # plot the model  
  plot(rf_model)  
}
```

plot.sits_accuracy *Plot confusion matrix*

Description

Plot a bar graph with informations about the confusion matrix

Usage

```
## S3 method for class 'sits_accuracy'  
plot(x, y, ..., title = "Confusion matrix")
```

Arguments

x	Object of class "plot.sits_accuracy".
y	Ignored.
...	Further specifications for plot .
title	Title of plot.

Value

A plot object produced by the ggplot2 package containing color bars showing the confusion between classes.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # show accuracy for a set of samples  
  train_data <- sits_sample(samples_modis_ndvi, n = 200)  
  test_data <- sits_sample(samples_modis_ndvi, n = 200)  
  # compute a random forest model  
  rfor_model <- sits_train(train_data, sits_rfor())  
  # classify training points  
  points_class <- sits_classify(  
    data = test_data, ml_model = rfor_model  
  )  
  # calculate accuracy  
  acc <- sits_accuracy(points_class)  
  # plot accuracy
```

```
    plot(acc)
  }
```

```
plot.som_evaluate_cluster
```

Plot confusion between clusters

Description

Plot a bar graph with informations about each cluster. The percentage of mixture between the clusters.

Usage

```
## S3 method for class 'som_evaluate_cluster'
plot(x, y, ..., name_cluster = NULL, title = "Confusion by cluster")
```

Arguments

x	Object of class "plot.som_evaluate_cluster".
y	Ignored.
...	Further specifications for plot .
name_cluster	Choose the cluster to plot.
title	Title of plot.

Value

A plot object produced by the ggplot2 package containing color bars showing the confusion between classes.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Lorena Santos <lorena.santos@inpe.br>

Examples

```

if (sits_run_examples()) {
  # create a SOM map
  som_map <- sits_som_map(samples_modis_ndvi)
  # evaluate the SOM cluster
  som_clusters <- sits_som_evaluate_cluster(som_map)
  # plot the SOM cluster evaluation
  plot(som_clusters)
}

```

plot.som_map

Plot a SOM map

Description

plots a SOM map generated by "sits_som_map" The plot function produces different plots based on the input data:

- "codes": Plot the vector weight for in each neuron.
- "mapping": Shows where samples are mapped.

Usage

```

## S3 method for class 'som_map'
plot(x, y, ..., type = "codes", band = 1)

```

Arguments

x	Object of class "som_map".
y	Ignored.
...	Further specifications for plot .
type	Type of plot: "codes" for neuron weight (time series) and "mapping" for the number of samples allocated in a neuron.
band	What band will be plotted.

Value

No return value, called for side effects.

Note

Please refer to the sits documentation available in [<https://e-sensing.github.io/sitsbook/>](https://e-sensing.github.io/sitsbook/) for detailed examples.

Author(s)

Gilberto Camara, [<gilberto.camara@inpe.br>](mailto:gilberto.camara@inpe.br)

Examples

```
if (sits_run_examples()) {  
  # create a SOM map  
  som_map <- sits_som_map(samples_modis_ndvi)  
  # plot the SOM map  
  plot(som_map)  
}
```

plot.torch_model *Plot Torch (deep learning) model*

Description

Plots a deep learning model developed using torch.

Usage

```
## S3 method for class 'torch_model'  
plot(x, y, ...)
```

Arguments

x	Object of class "torch_model".
y	Ignored.
...	Further specifications for plot .

Value

A plot object produced by the ggplot2 package showing the evolution of the loss and accuracy of the model.

Note

This code has been lifted from the "keras" package.

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Felipe Souza, <lipecaso@gmail.com>
Rolf Simoes, <rolf.simoes@inpe.br>
Alber Sanchez, <alber.ipia@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # Retrieve the samples for Mato Grosso  
  # train a tempCNN model  
  ml_model <- sits_train(samples_modis_ndvi, ml_method = sits_tempcnn)  
  # plot the model  
  plot(ml_model)  
}
```

plot.uncertainty_cube *Plot uncertainty cubes*

Description

plots a probability cube using stars

Usage

```
## S3 method for class 'uncertainty_cube'  
plot(x, ..., tile = x$tile[[1]], palette = "RdYlGn", rev = TRUE)
```

Arguments

x	Object of class "probs_image".
...	Further specifications for plot .
tile	Tiles to be plotted.
palette	An RColorBrewer palette
rev	Reverse the color order in the palette?

Value

A plot object produced by the stars package with a map showing the uncertainty associated to each classified pixel.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # create a random forest model  
  rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())  
  # create a data cube from local files  
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")  
  cube <- sits_cube(  
    source = "BDC",
```

```

        collection = "MOD13Q1-6",
        data_dir = data_dir,
        delim = "_",
        parse_info = c("X1", "tile", "band", "date")
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # calculate uncertainty
    uncert_cube <- sits_uncertainty(probs_cube, output_dir = tempdir())
    # plot the resulting uncertainty cube
    plot(uncert_cube)
}

```

plot.variance_cube *Plot variance cubes*

Description

plots a probability cube using stars

Usage

```

## S3 method for class 'variance_cube'
plot(
  x,
  ...,
  tile = x$tile[[1]],
  labels = NULL,
  palette = "YlGnBu",
  rev = FALSE,
  type = "map"
)

```

Arguments

x	Object of class "variance_cube".
...	Further specifications for plot .
tile	Tile to be plotted.
labels	Labels to plot (optional).
palette	RColorBrewer palette
rev	Reverse order of colors in palette?
type	Type of plot ("map" or "hist")

Value

A plot containing probabilities associated to each class for each pixel.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
  # create a random forest model
  rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # classify a data cube
  probs_cube <- sits_classify(
    data = cube, ml_model = rfor_model, output_dir = tempdir()
  )
  # obtain a variance cube
  var_cube <- sits_variance(probs_cube, output_dir = tempdir())
  # plot the variance cube
  plot(var_cube)
}
```

plot.xgb_model

Plot XGB model

Description

Plots the important variables in an extreme gradient boosting.

Usage

```
## S3 method for class 'xgb_model'
plot(x, ..., n_trees = 3)
```

Arguments

x	Object of class "xgb_model".
...	Further specifications for plot .
n_trees	Number of trees to be plotted

Value

A plot object.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # Retrieve the samples for Mato Grosso  
  # train an extreme gradient boosting  
  xgb_model <- sits_train(samples_modis_ndvi,  
    ml_method = sits_xgboost())  
  # plot the model  
  plot(xgb_model)  
}
```

point_mt_6bands

A time series sample with data from 2000 to 2016

Description

A dataset containing a tibble with one time series samples in the Mato Grosso state of Brazil. The time series comes from MOD13Q1 collection 6 images.

Usage

```
data(point_mt_6bands)
```

Format

A tibble with 1 rows and 7 variables: longitude: East-west coordinate of the time series sample (WGS 84), latitude (North-south coordinate of the time series sample in WGS 84), start_date (initial date of the time series), end_date (final date of the time series), label (the class label associated to the sample), cube (the name of the cube associated with the data), time_series (list containing a tibble with the values of the time series).

samples_l8_rondonia_2bands

Samples of Amazon tropical forest biome for deforestation analysis

Description

A sits tibble with time series samples from Brazilian Amazonia rain forest.

The labels are: "Deforestation", "Forest", "NatNonForest" and "Pasture".

The time series were extracted from the Landsat-8 BDC data cube (collection = "LC8_30_16D_STK-1", tiles = "038047"). These time series comprehends a period of 12 months (25 observations) from "2018-07-12" to "2019-07-28". The extracted bands are NDVI and EVI. Cloudy values were removed and interpolated.

Usage

```
data("samples_l8_rondonia_2bands")
```

Format

A sits tibble with 160 samples.

samples_modis_ndvi

Samples of nine classes for the state of Mato Grosso

Description

A dataset containing a tibble with time series samples for the Mato Grosso state in Brasil. The time series come from MOD13Q1 collection 6 images. The data set has the following classes: Cerrado(379 samples), Forest (131 samples), Pasture (344 samples), and Soy_Corn (364 samples).

Usage

```
data(samples_modis_ndvi)
```

Format

A tibble with 1308 rows and 7 variables: longitude: East-west coordinate of the time series sample (WGS 84), latitude (North-south coordinate of the time series sample in WGS 84), start_date (initial date of the time series), end_date (final date of the time series), label (the class label associated to the sample), cube (the name of the cube associated with the data), time_series (list containing a tibble with the values of the time series).

sits_accuracy	<i>Assess classification accuracy (area-weighted method)</i>
---------------	--------------------------------------------------------------

Description

This function calculates the accuracy of the classification result. For a set of time series, it creates a confusion matrix and then calculates the resulting statistics using the R package "caret". The time series needs to be classified using [sits_classify](#).

Classified images are generated using [sits_classify](#) followed by [sits_label_classification](#). For a classified image, the function uses an area-weighted technique proposed by Olofsson et al. according to [1-3] to produce more reliable accuracy estimates at 95

In both cases, it provides an accuracy assessment of the classified, including Overall Accuracy, Kappa, User's Accuracy, Producer's Accuracy and error matrix (confusion matrix)

Usage

```
sits_accuracy(data, ...)  
  
## S3 method for class 'sits'  
sits_accuracy(data, ...)  
  
## S3 method for class 'class_cube'  
sits_accuracy(data, validation = NULL, ..., validation_csv = NULL)
```

Arguments

data	Either a data cube with classified images or a set of time series
...	Specific parameters
validation	Samples for validation (see below) Only required when data is a data cube.
validation_csv	CSV file with samples (deprecated)

Value

A list of lists: The `error_matrix`, the `class_areas`, the unbiased estimated areas, the standard error areas, confidence interval 95 and the accuracy (user, producer, and overall), or NULL if the data is empty. A confusion matrix assessment produced by the caret package.

Note

The validation data needs to contain the following columns: "latitude", "longitude", "start_date", "end_date", and "label". It can be either a path to a CSV file, a sits tibble or a data frame.

  as <- sits_accuracy(label_cube, validation = ground_truth)
}

```

`sits_apply`*Apply a function on a set of time series*

Description

Apply a named expression to a sits cube or a sits tibble to be evaluated and generate new bands (indices). In the case of sits cubes, it materializes a new band in `output_dir` using `gdalcubes`.

Usage

```
sits_apply(data, ...)  
  
## S3 method for class 'sits'  
sits_apply(data, ...)  
  
## S3 method for class 'raster_cube'  
sits_apply(  
  data,  
  ...,  
  window_size = 3,  
  memsize = 1,  
  multicores = 2,  
  output_dir,  
  progress = TRUE  
)
```

Arguments

<code>data</code>	Valid sits tibble or cube
<code>...</code>	Named expressions to be evaluated (see details).
<code>window_size</code>	An odd number representing the size of the sliding window of sits kernel functions used in expressions (for a list of supported kernel functions, please see details).
<code>memsize</code>	Memory available for classification (in GB).
<code>multicores</code>	Number of cores to be used for classification.
<code>output_dir</code>	Directory where files will be saved.
<code>progress</code>	Show progress bar?

Details

`sits_apply()` allow any valid R expression to compute new bands. Use R syntax to pass an expression to this function. Besides arithmetic operators, you can use virtually any R function that can be applied to elements of a matrix (functions that are unaware of matrix sizes, e.g. `sqrt()`, `sin()`, `log()`).

Also, `sits_apply()` accepts a predefined set of kernel functions (see below) that can be applied to pixels considering its neighborhood. `sits_apply()` considers a neighborhood of a pixel as a set of pixels equidistant to it (including itself) according the Chebyshev distance. This neighborhood form a square window (also known as kernel) around the central pixel (Moore neighborhood). Users can set the `window_size` parameter to adjust the size of the kernel window. The image is conceptually mirrored at the edges so that neighborhood including a pixel outside the image is equivalent to take the 'mirrored' pixel inside the edge.

`sits_apply()` applies a function to the kernel and its result is assigned to a corresponding central pixel on a new matrix. The kernel slides throughout the input image and this process generates an entire new matrix, which is returned as a new band to the cube. The kernel functions ignores any NA values inside the kernel window. Central pixel is NA just only all pixels in the window are NA.

Value

A sits tibble or a sits cube with new bands, produced according to the requested expression.

Summarizing kernel functions

- `w_median()`: returns the median of the neighborhood's values.
- `w_sum()`: returns the sum of the neighborhood's values.
- `w_mean()`: returns the mean of the neighborhood's values.
- `w_sd()`: returns the standard deviation of the neighborhood's values.
- `w_var()`: returns the variance of the neighborhood's values.
- `w_min()`: returns the minimum of the neighborhood's values.
- `w_max()`: returns the maximum of the neighborhood's values.

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
  # Get a time series
  # Apply a normalization function

  point2 <-
    sits_select(point_mt_6bands, "NDVI") %>%
    sits_apply(NDVI_norm = (NDVI - min(NDVI)) / (max(NDVI) - min(NDVI)))

  # Example of generation texture band with variance
  # Create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
```

```

    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )

  # Generate a texture images with variance in NDVI images
  cube_texture <- sits_apply(
    data = cube,
    NDVITEXTURE = w_var(NDVI),
    window_size = 5,
    output_dir = tempdir()
  )
}

```

sits_as_sf

Return a sits_tibble or raster_cube as an sf object.

Description

Return a sits_tibble or raster_cube as an sf object.

Usage

```

sits_as_sf(data, ..., as_crs = NULL)

## S3 method for class 'sits'
sits_as_sf(data, ..., crs = "EPSG:4326", as_crs = NULL)

## S3 method for class 'raster_cube'
sits_as_sf(data, ..., as_crs = NULL)

```

Arguments

data	A sits tibble or sits cube.
...	Additional parameters.
as_crs	Output coordinate reference system.
crs	Input coordinate reference system.

Value

An sf object of point or polygon geometry.

Author(s)

Felipe Carvalho, <felipe.carvalho@inpe.br>
 Alber Sanchez, <alber.ipia@inpe.br>

Examples

```

if (sits_run_examples()) {
  # convert sits tibble to an sf object (point)
  sf_object <- sits_as_sf(cerrado_2classes)

  # convert sits cube to an sf object (polygon)
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  sf_object <- sits_as_sf(cube)
}

```

sits_bands

Get the names of the bands

Description

Finds the names of the bands of a set of time series or of a data cube

Usage

```

sits_bands(x)

## S3 method for class 'sits'
sits_bands(x)

## S3 method for class 'raster_cube'
sits_bands(x)

## S3 method for class 'patterns'
sits_bands(x)

## S3 method for class 'sits_model'
sits_bands(x)

```

Arguments

x Valid sits tibble (time series or a cube)

Value

A vector with the names of the bands.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>
Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
bands <- sits_bands(point_mt_6bands)
```

sits_bbox

Get the bounding box of the data

Description

Obtain a vector of limits (either on lat/long for time series or in projection coordinates in the case of cubes)

Usage

```
sits_bbox(data, ..., as_crs = NULL)

## S3 method for class 'sits'
sits_bbox(data, ..., crs = "EPSG:4326", as_crs = NULL)

## S3 method for class 'raster_cube'
sits_bbox(data, ..., as_crs = NULL)
```

Arguments

data	samples data or cube.
...	Additional parameters.
as_crs	CRS to project the resulting bbox.
crs	CRS of the samples points.

Value

A bbox.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>
Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
  sits_bbox(samples_modis_ndvi)
}
```

sits_classify	<i>Classify time series or data cubes</i>
---------------	-------------------------------------------

Description

This function classifies a set of time series or data cube given a trained model prediction model created by [sits_train](#).

SITS supports the following models:

- support vector machines: see [sits_svm](#)
- random forests: see [sits_rfor](#)
- extreme gradient boosting: see [sits_xgboost](#)
- multi-layer perceptrons: see [sits_mlp](#)
- 1D CNN: see [sits_tempcnn](#)
- deep residual networks: see [sits_resnet](#)
- self-attention encoders: see [sits_lighttae](#)

Usage

```
sits_classify(  
  data,  
  ml_model,  
  ...,  
  filter_fn = NULL,  
  multicores = 2,  
  progress = TRUE  
)  
  
## S3 method for class 'sits'  
sits_classify(  
  data,  
  ml_model,  
  ...,  
  filter_fn = NULL,  
  multicores = 2,  
  progress = TRUE  
)  
  
## S3 method for class 'raster_cube'  
sits_classify(  
  data,  
  ml_model,  
  ...,  
  roi = NULL,  
  filter_fn = NULL,  
)
```

```

    impute_fn = sits_impute_linear(),
    start_date = NULL,
    end_date = NULL,
    memsize = 8,
    multicores = 2,
    output_dir,
    version = "v1",
    verbose = FALSE,
    progress = TRUE
  )

```

Arguments

<code>data</code>	Data cube.
<code>ml_model</code>	R model trained by sits_train .
<code>...</code>	Other parameters for specific functions.
<code>filter_fn</code>	Smoothing filter to be applied (if desired).
<code>multicores</code>	Number of cores to be used for classification.
<code>progress</code>	Show progress bar?
<code>roi</code>	Region of interest (see below)
<code>impute_fn</code>	Impute function to replace NA.
<code>start_date</code>	Start date for the classification.
<code>end_date</code>	End date for the classification.
<code>memsize</code>	Memory available for classification (in GB).
<code>output_dir</code>	Directory for output file.
<code>version</code>	Version of the output (for multiple classifications).
<code>verbose</code>	Print information about processing time?

Value

Predicted data (classified time series) or a data cube with probabilities for each class.

Note

The "roi" parameter defines a region of interest. It can be an `sf_object`, a shapefile, or a bounding box vector with named XY values ("xmin", "xmax", "ymin", "ymax") or named lat/long values ("lon_min", "lat_min", "lon_max", "lat_max")

The "filter_fn" parameter specifies a smoothing filter to be applied to time series for reducing noise. Currently, options include Savitzky-Golay (see [sits_sgolay](#)) and Whittaker (see [sits_whittaker](#)).

The "impute_fn" function is used to remove invalid or cloudy pixels from time series. The default is a linear interpolator, available in [sits_impute_linear](#). Users can add their custom functions.

The "memsize" and "multicores" parameters are used for multiprocessing. The "multicores" parameter defines the number of cores used for processing. The "memsize" parameter controls the amount

of memory available for classification. We recommend using a 4:1 relation between "memsize" and "multicores".

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

  # classify the point
  point_ndvi <- sits_select(point_mt_6bands, bands = c("NDVI"))
  point_class <- sits_classify(
    data = point_ndvi, ml_model = rf_model
  )
  plot(point_class)

  # Example of classification of a data cube
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # classify a data cube
  probs_cube <- sits_classify(
    data = cube, ml_model = rf_model, output_dir = tempdir()
  )
  # label the probability cube
  label_cube <- sits_label_classification(
    probs_cube, output_dir = tempdir()
  )
  # plot the classified image
  plot(label_cube)
}
```

sits_clustering *Find clusters in time series samples*

Description

These functions support hierarchical agglomerative clustering in sits. They provide support from creating a dendrogram and using it for cleaning samples.

`sits_cluster_dendro()` takes a tibble containing time series and produces a sits tibble with an added "cluster" column. The function first calculates a dendrogram and obtains a validity index for best clustering using the adjusted Rand Index. After cutting the dendrogram using the chosen validity index, it assigns a cluster to each sample.

`sits_cluster_frequency()` computes the contingency table between labels and clusters and produces a matrix. It needs as input a tibble produced by `sits_cluster_dendro()`.

`sits_cluster_clean()` takes a tibble with time series that has an additional 'cluster' produced by `sits_cluster_dendro()` and removes labels that are minority in each cluster.

Usage

```
sits_cluster_dendro(
  samples = NULL,
  bands = NULL,
  dist_method = "dtw_basic",
  linkage = "ward.D2",
  k = NULL,
  palette = "RdYlGn",
  .plot = TRUE,
  ...
)
```

Arguments

<code>samples</code>	Tibble with input set of time series.
<code>bands</code>	Bands to be used in the clustering.
<code>dist_method</code>	Distance method.
<code>linkage</code>	Agglomeration method. Can be any 'hclust' method (see 'hclust'). Default is 'ward.D2'.
<code>k</code>	Desired number of clusters (overrides default value)
<code>palette</code>	Color palette as per 'grDevices::hcl.pals()' function.
<code>.plot</code>	Plot the dendrogram?
<code>...</code>	Additional parameters to be passed to <code>dtwclust::tsclust()</code> function.

Value

Tibble with added "cluster" column.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

References

"dtwclust" package (<https://CRAN.R-project.org/package=dtwclust>)

Examples

```
if (sits_run_examples()) {  
  clusters <- sits_cluster_dendro(cerrado_2classes)  
}
```

sits_cluster_clean *Removes labels that are minority in each cluster.*

Description

Takes a tibble with time series that has an additional ‘cluster’ produced by `sits_cluster_dendro()` and removes labels that are minority in each cluster.

Usage

```
sits_cluster_clean(samples)
```

Arguments

`samples` Tibble with input set of time series with additional cluster information produced by `sits::sits_cluster_dendro()`.

Value

Tibble with time series where clusters have been cleaned of labels that were in a minority at each cluster.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {  
  clusters <- sits_cluster_dendro(cerrado_2classes)  
  freq1 <- sits_cluster_frequency(clusters)  
  freq1  
  clean_clusters <- sits_cluster_clean(clusters)  
  freq2 <- sits_cluster_frequency(clean_clusters)  
  freq2  
}
```

sits_cluster_frequency

Show label frequency in each cluster produced by dendrogram analysis

Description

Show label frequency in each cluster produced by dendrogram analysis

Usage

```
sits_cluster_frequency(samples)
```

Arguments

samples Tibble with input set of time series with additional cluster information produced by `sits::sits_cluster_dendro`.

Value

A matrix containing frequencies of labels in clusters.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {  
  clusters <- sits_cluster_dendro(cerrado_2classes)  
  freq <- sits_cluster_frequency(clusters)  
  freq  
}
```

`sits_colors`*Function to retrieve sits color table*

Description

Returns a color table

Usage

```
sits_colors()
```

Value

A tibble with color names and values

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # show the names of the colors supported by SITS  
  sits_colors()  
}
```

`sits_colors_reset`*Function to reset sits color table*

Description

Resets the color table

Usage

```
sits_colors_reset()
```

Value

No return, called for side effects

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

sits_colors_set *Function to set sits color table*

Description

Sets a color table

Usage

```
sits_colors_set(color_tb)
```

Arguments

color_tb New color table

Value

A modified sits color table

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

sits_colors_show *Function to show colors in SITS*

Description

Shows the default SITS colors

Usage

```
sits_colors_show()
```

Value

no return, called for side effects

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # show the colors supported by SITS  
  sits_colors_show()  
}
```

sits_color_value *Function to retrieve sits color value*

Description

Returns a color value based on name

Usage

```
sits_color_value(name)
```

Arguments

name Name of color to obtain values

Value

A color value used in sits

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # show the names of the colors supported by SITS  
  sits_color_value("Water")  
}
```

sits_combine_predictions
Estimate ensemble prediction based on list of probs cubes

Description

Calculate an ensemble predictor based a list of probability cubes. The function combines the output of two or more classifier to derive a value which is based on weights assigned to each model. The supported types of ensemble predictors are 'average' and 'uncertainty'.

Usage

```

sits_combine_predictions(
  cubes,
  type = "average",
  ...,
  memsize = 8,
  multicores = 2,
  output_dir,
  version = "v1"
)

## S3 method for class 'average'
sits_combine_predictions(
  cubes,
  type = "average",
  ...,
  weights = NULL,
  memsize = 8,
  multicores = 2,
  output_dir,
  version = "v1"
)

## S3 method for class 'uncertainty'
sits_combine_predictions(
  cubes,
  type = "uncertainty",
  ...,
  uncert_cubes,
  memsize = 8,
  multicores = 2,
  output_dir,
  version = "v1"
)

```

Arguments

cubes	List of probability data cubes.
type	Method to measure uncertainty. See details.
...	Parameters for specific functions.
memsize	Maximum overall memory (in GB) to run the function.
multicores	Number of cores to run the function.
output_dir	Output directory for image files.
version	Version of resulting image. (in the case of multiple tests)
weights	Weights for averaging
uncert_cubes	Uncertainty cubes to be used as local weights.

Value

A combined probability cube

Note

Please refer to the sits documentation available in [<https://e-sensing.github.io/sitsbook/>](https://e-sensing.github.io/sitsbook/) for detailed examples.

Gilberto Camara, [<gilberto.camara@inpe.br>](mailto:gilberto.camara@inpe.br)

Rolf Simoes, [<rolf.simoes@inpe.br>](mailto:rolf.simoes@inpe.br)

Examples

```
if (sits_run_examples()) {
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # create a random forest model
  rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
  # classify a data cube using rfor model
  probs_rfor_cube <- sits_classify(
    data = cube, ml_model = rfor_model, output_dir = tempdir(),
    version = "rfor"
  )
  # create an XGBoost model
  tcnn_model <- sits_train(samples_modis_ndvi, sits_tempcnn())
  # classify a data cube using tempcnn model
  probs_tcnn_cube <- sits_classify(
    data = cube, ml_model = tcnn_model, output_dir = tempdir(),
    version = "tcnn"
  )
  # create a list of predictions to be combined
  pred_cubes <- list(probs_rfor_cube, probs_tcnn_cube)
  # combine predictions
  comb_probs_cube <- sits_combine_predictions(
    pred_cubes, output_dir = tempdir()
  )
  # plot the resulting combined prediction cube
  plot(comb_probs_cube)
}
```

`sits_confidence_sampling`*Suggest high confidence samples to increase the training set.*

Description

Suggest points for increasing the training set. These points are labelled with high confidence so they can be added to the training set. They need to have a satisfactory margin of confidence to be selected. The input is a probability cube. For each label, the algorithm finds out location where the machine learning model has high confidence in choosing this label compared to all others. The algorithm also considers a minimum distance between new labels, to minimize spatial autocorrelation effects.

This function is best used in the following context

- 1. Select an initial set of samples.
- 2. Train a machine learning model.
- 3. Build a data cube and classify it using the model.
- 4. Run a Bayesian smoothing in the resulting probability cube.
- 5. Create an uncertainty cube.
- 6. Perform confidence sampling.

The Bayesian smoothing procedure will reduce the classification outliers and thus increase the likelihood that the resulting pixels will provide good quality samples for each class.

Usage

```
sits_confidence_sampling(  
  probs_cube,  
  n = 20,  
  min_margin = 0.9,  
  sampling_window = 10  
)
```

Arguments

<code>probs_cube</code>	A probability cube. See <code>sits_classify</code> .
<code>n</code>	Number of suggested points per class.
<code>min_margin</code>	Minimum margin of confidence to select a sample
<code>sampling_window</code>	Window size for collecting points (in pixels). The minimum window size is 10.

Value

A tibble with longitude and latitude in WGS84 with locations which have high uncertainty and meet the minimum distance criteria.

 Rolf Simoes, <rolf.simoes@inpe.br>
 Felipe Carvalho, <felipe.carvalho@inpe.br>
 Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
  # create a data cube
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # build a random forest model
  rfor_model <- sits_train(samples_modis_ndvi, ml_method = sits_rfor())
  # classify the cube
  probs_cube <- sits_classify(
    data = cube, ml_model = rfor_model, output_dir = tempdir()
  )
  # obtain a new set of samples for active learning
  # the samples are located in uncertain places
  new_samples <- sits_confidence_sampling(probs_cube)
}
```

sits_configuration *Configure parameters for sits package*

Description

These functions load and show sits configurations.

The 'sits' package uses a configuration file that contains information on parameters required by different functions. This includes information about the image collections handled by 'sits'.

`sits_config()` loads the default configuration file and the user provided configuration file. The final configuration is obtained by overriding the options by the values provided in `processing_bloat`, `rstac_pagination_limit`, `raster_api_package`, and `gdal_creation_options` parameters.

`sits_config_show()` prints the current sits configuration options. To show specific configuration options for a source, a collection, or a palette, users can inform the corresponding keys to source, collection, and palette parameters.

`sits_list_collections()` prints the collections available in each cloud service supported by sits. Users can select to get information only for a single service by using the source parameter.

Usage

```
sits_config(
  run_tests = NULL,
  run_examples = NULL,
  processing_bloat = NULL,
  rstac_pagination_limit = NULL,
  raster_api_package = NULL,
  gdal_creation_options = NULL,
  gdalcubes_chunk_size = NULL,
  leaflet_max_megabytes = NULL,
  leaflet_comp_factor = NULL,
  reset = FALSE
)

sits_config_show(source = NULL, collection = NULL, colors = FALSE)

sits_list_collections(source = NULL)
```

Arguments

run_tests	Should tests be run?
run_examples	Should examples be run?
processing_bloat	Estimated growth size of R memory relative to block size.
rstac_pagination_limit	Limit of number of items returned by STAC.
raster_api_package	Supported raster handling package.
gdal_creation_options	GDAL creation options for GeoTiff.
gdalcubes_chunk_size	Chunk size to be used by gdalcubes
leaflet_max_megabytes	Max image size of an image for leaflet (in MB)
leaflet_comp_factor	Compression factor for leaflet RGB display.
reset	Should current configuration options be cleaned before loading config files? Default is FALSE.
source	Data source to be shown in detail.
collection	Collection key entry to be shown in detail.
colors	Show colors?

Details

Users can provide additional configuration files, by specifying the location of their file in the environmental variable `SITS_CONFIG_USER_FILE`.

To see the key entries and contents of the current configuration values, use `sits_config_show()`.

Value

sits_config() returns a list containing the final configuration options.

A list containing the respective configuration printed in the console.

Prints collections available in each cloud service supported by sits.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
current_config <- sits_config()
sits_config_show()
```

sits_cube

Create data cubes from image collections

Description

Creates a data cube based on spatial and temporal restrictions in collections available in cloud services or local repositories. The following cloud providers are supported, based on the STAC protocol:

- "AWS": Amazon Web Services (AWS), see <https://registry.opendata.aws/>
- "BDC": Brazil Data Cube (BDC), see <http://brazildatacube.org/>
- "DEAFRICA": Digital Earth Africa, see <https://www.digitalearthafrika.org/>
- "MPC": Microsoft Planetary Computer, see <https://planetarycomputer.microsoft.com/>
- "USGS": USGS LANDSAT collection, see <https://registry.opendata.aws/usgs-landsat/>

Data cubes can also be created using local files (see details).

Usage

```
sits_cube(source, collection, ..., data_dir = NULL)
```

```
## S3 method for class 'stac_cube'
```

```
sits_cube(
  source,
  collection,
  ...,
  data_dir = NULL,
  bands = NULL,
  tiles = NULL,
  roi = NULL,
```

```

    start_date = NULL,
    end_date = NULL,
    platform = NULL,
    progress = TRUE
)

## S3 method for class 'local_cube'
sits_cube(
  source,
  collection,
  data_dir,
  ...,
  tiles = NULL,
  bands = NULL,
  start_date = NULL,
  end_date = NULL,
  labels = NULL,
  parse_info = NULL,
  version = "v1",
  delim = "_",
  multicores = 2,
  progress = TRUE
)

```

Arguments

source	Data source (one of "AWS", "BDC", "DEAFRICA", "MPC", "USGS").
collection	Image collection in data source (To find out the supported collections, use sits_list_collections()).
...	Other parameters to be passed for specific types.
data_dir	Local directory where images are stored (for local cubes).
bands	Spectral bands and indices to be included in the cube (optional).
tiles	Tiles from the collection to be included in the cube (see details below).
roi	Filter collection by region of interest (see details below).
start_date, end_date	Initial and final dates to include images from the collection in the cube (optional).
platform	Optional parameter specifying the platform in case of collections that include more than one satellite.
progress	Show a progress bar?
labels	Labels associated to the classes (only for result cubes).
parse_info	Parsing information for local files.
version	Version of the classified and/or labelled files.
delim	Delimiter for parsing local files.
multicores	Number of workers for parallel processing

Details

To create cubes from cloud providers, users need to inform:

- `source`: One of "AWS", "BDC", "DEAFRICA", "MPC", "USGS".
- `collection`: Use `sits_list_collections()` to see which collections are supported.
- `tiles`: A set of tiles defined according to the collection tiling grid.
- `roi`: Region of interest in WGS84 coordinates.

Either `tiles` or `roi` must be informed. The parameters `bands`, `start_date`, and `end_date` are optional for cubes created from cloud providers.

The `roi` parameter allows a selection of an area of interest, either using a named vector ("`lon_min`", "`lat_min`", "`lon_max`", "`lat_max`") in WGS84, a `sfc` or `sf` object from `sf` package in WGS84 projection. GeoJSON geometries (RFC 7946) and shapefiles should be converted to `sf` objects before being used to define a region of interest. This parameter does not crop a region; it only selects images that intersect the `roi`.

To create a cube from local files, users need to inform:

- `source`: Provider from where the data has been downloaded (e.g, "BDC", "AWS").
- `collection`: Collection where the data has been extracted from.
- `data_dir`: Local directory where images are stored.
- `parse_info`: Parsing information for files (see below).
- `delim`: Delimiter character for parsing files (see below).

To create a cube from local files, all images should have the same spatial resolution and projection and each file should contain a single image band for a single date. Files can belong to different tiles of a spatial reference system and file names need to include tile, date, and band information. For example: "CBERS-4_022024_B13_2018-02-02.tif" and "cube_20LKP_B02_2018-07-18.jp2" are accepted names. The user has to provide parsing information to allow `sits` to extract values of tile, band, and date. In the examples above, the parsing info is `c("X1", "tile", "band", "date")` and the delimiter is "_".

It is also possible to create result cubes; these are local cubes that have been produced by classification or post-classification algorithms. In this case, there are more parameters that are required (see below) and the parameter `parse_info` is specified differently:

- `band`: The band name is associated to the type of result. Use "probs", for probability cubes produced by `sits_classify()`; "bayes", for smoothed cubes produced by `sits_smooth()`; "entropy" when using `sits_uncertainty()`, or "class" for cubes produced by `sits_label_classification()`.
- `labels`: Labels associated to the classification results.
- `parse_info`: File name parsing information has to allow `sits` to deduce the values of "tile", "start_date", "end_date" from the file name. Default is `c("X1", "X2", "tile", "start_date", "end_date", "band")`. Note that, unlike non-classified image files, cubes with results have both "start_date" and "end_date".

Value

A tibble describing the contents of a data cube.

Note

In MPC, sits can access are two open data collections: "SENTINEL-S2-L2A" for Sentinel-2/2A images, and "LANDSAT-C2-L2" for the Landsat-4/5/7/8/9 collection. (requester-pays) and "SENTINEL-S2-L2A-COGS" (open data).

Sentinel-2/2A level 2A files in MPC are organized by sensor resolution. The bands in 10m resolution are "B02", "B03", "B04", and "B08". The 20m bands are "B05", "B06", "B07", "B8A", "B11", and "B12". Bands "B01" and "B09" are available at 60m resolution. The "CLOUD" band is also available.

All Landsat-4/5/7/8/9 images in MPC have bands with 30 meter resolution. To account for differences between the different sensors, Landsat bands in this collection have been renamed "BLUE", "GREEN", "RED", "NIR08", "SWIR16" and "SWIR22". The "CLOUD" band is also available.

In AWS, there are two types of collections: open data and requester-pays. Currently, sits supports collection "SENTINEL-S2-L2A" (requester-pays) and "SENTINEL-S2-L2A-COGS" (open data). There is no need to provide AWS credentials to access open data collections. For requester-pays data, users need to provide their access codes as environment variables, as follows: `Sys.setenv(AWS_ACCESS_KEY_ID = <your_access_key>, AWS_SECRET_ACCESS_KEY = <your_secret_access_key>)`

Sentinel-2/2A level 2A files in AWS are organized by sensor resolution. The AWS bands in 10m resolution are "B02", "B03", "B04", and "B08". The 20m bands are "B05", "B06", "B07", "B8A", "B11", and "B12". Bands "B01" and "B09" are available at 60m resolution.

For DEAFRICA, sits currently works with collection "S2_L2A" (open data). This collection is the same as AWS collection "SENTINEL-S2-L2A-COGS", and is located in Africa (Capetown) for faster access to African users. No payment for access is required.

For USGS, sits currently works with collection "LANDSAT-C2L2-SR", which corresponds to Landsat Collection 2 Level-2 surface reflectance data, covering Landsat-8 dataset. This collection is requester-pays and requires payment for accessing.

All BDC collections are regularized. BDC users need to provide their credentials using environment variables. To create your credentials, please see <brazil-data-cube.github.io/applications/dc_explorer/token-module.html>. Accessing data in the BDC is free. After obtaining the BDC access key, please include it as an environment variable, as follows: `Sys.setenv(BDC_ACCESS_KEY = <your_bdc_access_key>)`

Please refer to the sits documentation available in <<https://e-sensing.github.io/sitsbook/>> for detailed examples.

)
}

```

sits_cube_copy

Copy the images of a cube to a local directory

Description

This function downloads the images of a cube in parallel. A region of interest (roi) can be provided to crop the images and a resolution (res) to resample the bands.

Usage

```

sits_cube_copy(
  cube,
  roi = NULL,
  res = NULL,
  multicores = 2,
  output_dir,
  progress = TRUE
)

```

Arguments

cube	A sits cube
roi	A Region of interest. See details below.
res	An integer value corresponds to the output spatial resolution of the images. Default is NULL.

multicores	Number of workers for parallel downloading.
output_dir	Output directory where images will be saved.
progress	Show progress bar?

Value

a sits cube with updated metadata.

Note

The `roi` parameter defines a region of interest. It can be an `sf_object`, a shapefile, or a bounding box vector with named XY values ("`xmin`", "`xmax`", "`ymin`", "`ymax`") or named lat/long values ("`lon_min`", "`lat_min`", "`lon_max`", "`lat_max`")

Examples

```
if (sits_run_examples()) {
  # Creating a sits cube from BDC
  bdc_cube <- sits_cube(
    source = "BDC",
    collection = "CB4_64_16D_STK-1",
    tiles = c("022024", "022025"),
    bands = c("B15", "CLOUD"),
    start_date = "2018-01-01",
    end_date = "2018-01-12"
  )

  # Downloading images to a temporary directory
  cube_local <- sits_cube_copy(
    cube = bdc_cube,
    output_dir = tempdir(),
    roi = c(lon_min = -42.28469009,
            lat_min = -14.95411527,
            lon_max = -41.74745556,
            lat_max = -14.65950650),
    multicores = 2
  )
}
```

Description

Filtering functions should be used with '`sits_filter()`'. The following filtering functions is supported by 'sits':

'sits_whittaker()': The algorithm searches for an optimal warping polynomial. The degree of smoothing depends on smoothing factor lambda (usually from 0.5 to 10.0). Use lambda = 0.5 for very slight smoothing and lambda = 5.0 for strong smoothing.

'sits_filter()': applies a filter to all bands.

'sits_sgolay()': An optimal polynomial for warping a time series. The degree of smoothing depends on the filter order (usually 3.0). The order of the polynomial uses the parameter 'order' (default = 3), the size of the temporal window uses the parameter 'length' (default = 5).

Usage

```
sits_whittaker(data = NULL, lambda = 0.5)
```

```
sits_filter(data, filter = sits_whittaker())
```

```
sits_sgolay(data = NULL, order = 3, length = 5)
```

Arguments

data	Time series or matrix.
lambda	Smoothing factor to be applied (default 0.5).
filter	a filter function such as 'sits_whittaker()' or 'sits_sgolay()'.
order	Filter order (integer).
length	Filter length (must be odd).

Value

Filtered time series

# Plot the two points to see the smoothing effect
plot(point_ndvi)
}

```

sits_formula_linear *Define a linear formula for classification models*

Description

Provides a symbolic description of a fitting model. Tells the model to do a linear transformation of the input values. The 'predictors_index' parameter informs the positions of fields corresponding to formula independent variables. If no value is given, that all fields will be used as predictors.

Usage

```
sits_formula_linear(predictors_index = -2:0)
```

Arguments

predictors_index

Index of the valid columns whose names are used to compose formula (default: -2:0).

Value

A function that computes a valid formula using a linear function.

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # Example of training a model for time series classification  
  # Retrieve the samples for Mato Grosso  
  # train an SVM model  
  ml_model <- sits_train(samples_modis_ndvi,  
    ml_method = sits_svm(formula = sits_formula_logref()))  
  # classify the point  
  point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")  
  # classify the point  
  point_class <- sits_classify(  
    data = point_ndvi, ml_model = ml_model  
  )  
  plot(point_class)  
}
```

sits_formula_logref *Define a loglinear formula for classification models*

Description

A function to be used as a symbolic description of some fitting models such as svm and random forest. This function tells the models to do a log transformation of the inputs. The ‘predictors_index’ parameter informs the positions of ‘tb’ fields corresponding to formula independent variables. If no value is given, the default is NULL, a value indicating that all fields will be used as predictors.

Usage

```
sits_formula_logref(predictors_index = -2:0)
```

Arguments

predictors_index
Index of the valid columns to compose formula (default: -2:0).

Value

A function that computes a valid formula using a log function.

Author(s)

  # Retrieve the samples for Mato Grosso  
  # train an SVM model  
  ml_model <- sits_train(samples_modis_ndvi,  
    ml_method = sits_svm(formula = sits_formula_logref()))  
  # classify the point  
  point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")  
  # classify the point  
  point_class <- sits_classify(  
    data = point_ndvi, ml_model = ml_model  
  )  
  plot(point_class)  
}
```

sits_geo_dist	<i>Compute the minimum distances among samples and prediction points.</i>
---------------	---------------------------------------------------------------------------

Description

Compute the minimum distances among samples and samples to prediction points, following the approach proposed by Meyer and Pebesma(2022).

Usage

```
sits_geo_dist(samples, roi, n = 1000, crs = "EPSG:4326")
```

Arguments

samples	A samples training data set.
roi	A region of interest (ROI) used to extract random predicted points.
n	Maximum number of samples to consider.
crs	CRS of the samples.

Value

A tibble with sample-to-sample and sample-to-prediction distances.

Author(s)

Alber Sanchez, <alber.ipia@inpe.br>
Rolf Simoes, <rolf.simoes@inpe.br>
Felipe Carvalho, <felipe.carvalho@inpe.br>
Gilberto Camara, <gilberto.camara@inpe.br>

References

Meyer, H., Pebesma, E. "Machine learning-based global maps of ecological variables and the challenge of assessing them", Nature Communications 13, 2208 (2022). <https://doi.org/10.1038/s41467-022-29838-9>

Examples

```
if (sits_run_examples()) {
  # read a shapefile for the state of Mato Grosso, Brazil
  mt_shp <- system.file("extdata/shapefiles/mato_grosso/mt.shp",
    package = "sits"
  )
  # convert to an sf object
  mt_sf <- sf::read_sf(mt_shp)
  # calculate sample-to-sample and sample-to-prediction distances
  distances <- sits_geo_dist(samples = samples_modis_ndvi,
    roi = mt_sf)
  # plot sample-to-sample and sample-to-prediction distances
  plot(distances)
}
```

sits_get_data

Get time series from data cubes and cloud services

Description

Retrieve a set of time series from a data cube or from a time series service. Data cubes and puts it in a "sits tibble". Sits tibbles are the main structures of sits package. They contain both the satellite image time series and their metadata.

Usage

```
sits_get_data(
  cube,
  samples,
  ...,
  start_date = as.Date(sits_timeline(cube)[1]),
  end_date = as.Date(sits_timeline(cube)[length(sits_timeline(cube))]),
  label = "NoClass",
  bands = sits_bands(cube),
  crs = 4326,
  impute_fn = sits_impute_linear(),
  label_attr = NULL,
  n_sam_pol = 30,
  pol_avg = FALSE,
  pol_id = NULL,
  multicores = 2,
  progress = FALSE
```

```
)

## Default S3 method:
sits_get_data(cube, samples, ...)

## S3 method for class 'csv'
sits_get_data(
  cube,
  samples,
  ...,
  bands = sits_bands(cube),
  crs = 4326,
  impute_fn = sits_impute_linear(),
  multicores = 2,
  progress = FALSE
)

## S3 method for class 'shp'
sits_get_data(
  cube,
  samples,
  ...,
  label = "NoClass",
  start_date = as.Date(sits_timeline(cube)[1]),
  end_date = as.Date(sits_timeline(cube)[length(sits_timeline(cube))]),
  bands = sits_bands(cube),
  impute_fn = sits_impute_linear(),
  label_attr = NULL,
  n_sam_pol = 30,
  pol_avg = FALSE,
  pol_id = NULL,
  multicores = 2,
  progress = FALSE
)

## S3 method for class 'sf'
sits_get_data(
  cube,
  samples,
  ...,
  bands = sits_bands(cube),
  start_date = as.Date(sits_timeline(cube)[1]),
  end_date = as.Date(sits_timeline(cube)[length(sits_timeline(cube))]),
  impute_fn = sits_impute_linear(),
  label = "NoClass",
  label_attr = NULL,
  n_sam_pol = 30,
  pol_avg = FALSE,
```

```

    pol_id = NULL,
    multicores = 2,
    progress = FALSE
)

## S3 method for class 'sits'
sits_get_data(
  cube,
  samples,
  ...,
  bands = sits_bands(cube),
  impute_fn = sits_impute_linear(),
  multicores = 2,
  progress = FALSE
)

## S3 method for class 'data.frame'
sits_get_data(
  cube,
  samples,
  ...,
  start_date = as.Date(sits_timeline(cube)[1]),
  end_date = as.Date(sits_timeline(cube)[length(sits_timeline(cube))]),
  label = "NoClass",
  bands = sits_bands(cube),
  crs = 4326,
  impute_fn = sits_impute_linear(),
  multicores = 2,
  progress = FALSE
)

```

Arguments

<code>cube</code>	Data cube from where data is to be retrieved.
<code>samples</code>	Samples location (sits, sf, or data.frame).
<code>...</code>	Specific parameters for specific cases.
<code>start_date</code>	Start of the interval for the time series in "YYYY-MM-DD" format (optional).
<code>end_date</code>	End of the interval for the time series in "YYYY-MM-DD" format (optional).
<code>label</code>	Label to be assigned to the time series (optional).
<code>bands</code>	Bands to be retrieved (optional).
<code>crs</code>	A coordinate reference system of samples. The provided crs could be a character (e.g. "EPSG:4326" or "WGS84" or a proj4string), or a numeric with the EPSG code (e.g. 4326). This parameter only works for 'csv' or data.frame' samples. Default is 4326.
<code>impute_fn</code>	Imputation function for NA values.
<code>label_attr</code>	Attribute in the shapefile or sf object to be used as a polygon label.

n_sam_pol	Number of samples per polygon to be read (for POLYGON or MULTIPOLYGON shapefile).
pol_avg	Summarize samples for each polygon?
pol_id	ID attribute for polygons.
multicores	Number of threads to process the time series.
progress	A logical value indicating if a progress bar should be shown. Default is FALSE.

Value

A tibble with the metadata and data for each time series <longitude, latitude, start_date, end_date, label, cube, time_series>.

Note

There are four ways of specifying data to be retrieved using the "samples" parameter:

- CSV file: Provide a CSV file with columns "longitude", "latitude", "start_date", "end_date" and "label" for each sample
- SHP file: Provide a shapefile in POINT or POLYGON geometry containing the location of the samples and an attribute to be used as label. Also, provide start and end date for the time series.
- sits object: A sits tibble.
- sf object: An "sf" object with POINT or POLYGON geometry.
- data.frame: A data.frame with with mandatory columns "longitude", "latitude".

Please refer to the sits documentation available in <<https://e-sensing.github.io/sitsbook/>> for detailed examples.

  time_series_bdc <- sits_get_data(
    cube = bdc_cube,
    samples = shp_file)
}
}

```

sits_impute_linear *Replace NA values with linear interpolation*

Description

Remove NA by linear interpolation

Usage

```
sits_impute_linear(data = NULL)
```

Arguments

data A time series vector or matrix

Value

A set of filtered time series using the imputation function.

Author(s)

    package = "sits"
  )
  points <- sits_get_data(cube = raster_cube, samples = csv_file)
}
```

sits_kfold_validate *Cross-validate time series samples*

Description

Splits the set of time series into training and validation and perform k-fold cross-validation. Cross-validation is a technique for assessing how the results of a statistical analysis will generalize to an independent data set. It is mainly used in settings where the goal is prediction, and one wants to estimate how accurately a predictive model will perform. One round of cross-validation involves partitioning a sample of data into complementary subsets, performing the analysis on one subset (called the training set), and validating the analysis on the other subset (called the validation set or testing set).

The k-fold cross validation method involves splitting the dataset into k-subsets. For each subset is held out while the model is trained on all other subsets. This process is completed until accuracy is determine for each instance in the dataset, and an overall accuracy estimate is provided.

This function returns the confusion matrix, and Kappa values.

Usage

```
sits_kfold_validate(  
  samples,  
  folds = 5,  
  ml_method = sits_rfor(),  
  multicores = 2  
)
```

Arguments

samples	Time series.
folds	Number of partitions to create.
ml_method	Machine learning method.
multicores	Number of cores to process in parallel.

Value

A `caret::confusionMatrix` object to be used for validation assessment.

Note

Please refer to the sits documentation available in [<https://e-sensing.github.io/sitsbook/>](https://e-sensing.github.io/sitsbook/) for detailed examples.

Gilberto Camara, [<gilberto.camara@inpe.br>](mailto:gilberto.camara@inpe.br)

Examples

```
if (sits_run_examples()) {  
  # A dataset containing a tibble with time series samples  
  # for the Mato Grosso state in Brasil  
  # create a list to store the results  
  results <- list()  
  
  # accuracy assessment lightTAE  
  acc_ltae <- sits_kfold_validate(  
    samples_modis_ndvi,  
    folds = 5,  
    ml_method = sits_lighttae()  
  )  
  # use a name  
  acc_ltae$name <- "LightTAE"  
  # put the result in a list  
  results[[length(results) + 1]] <- acc_ltae  
  
  # Machine Learning - Random Forests
```

```
acc_rf <- sits_kfold_validate(  
  samples_modis_ndvi,  
  folds = 5,  
  ml_method = sits_rfor()  
)  
acc_rf$name <- "RandomForests"  
# put the result in a list  
results[[length(results) + 1]] <- acc_rf  
# save to xlsx file  
sits_to_xlsx(  
  results,  
  file = tempfile("accuracy_mato_grosso_dl_", fileext = ".xlsx")  
)  
}
```

sits_labels

Get labels associated to a data set

Description

Finds labels in a sits tibble or data cube

Usage

```
sits_labels(data)  
  
## S3 method for class 'sits'  
sits_labels(data)  
  
## S3 method for class 'raster_cube'  
sits_labels(data)  
  
## S3 method for class 'patterns'  
sits_labels(data)  
  
## S3 method for class 'sits_model'  
sits_labels(data)
```

Arguments

data Time series or a cube.

Value

The labels associated to a set of time series or to a data cube.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
# read a tibble with 400 samples of Cerrado and 346 samples of Pasture
data(cerrado_2classes)
# print the labels
sits_labels(cerrado_2classes)
```

sits_labels_summary *Inform label distribution of a set of time series*

Description

Describes labels in a sits tibble

Usage

```
sits_labels_summary(data)

## S3 method for class 'sits'
sits_labels_summary(data)
```

Arguments

data Valid sits tibble

Value

A tibble with the frequency of each label.

Author(s)

Rolf Simoes, <rolf.simoese@inpe.br>

Examples

```
# read a tibble with 400 samples of Cerrado and 346 samples of Pasture
data(cerrado_2classes)
# print the labels
sits_labels_summary(cerrado_2classes)
```

```
sits_label_classification
```

Build a labelled image from a probability cube

Description

Takes a set of classified raster layers with probabilities, and label them based on the maximum probability for each pixel.

Usage

```
sits_label_classification(
  cube,
  memsize = 4,
  multicores = 2,
  output_dir,
  version = "v1",
  progress = TRUE
)

## S3 method for class 'probs_cube'
sits_label_classification(
  cube,
  memsize = 4,
  multicores = 2,
  output_dir,
  version = "v1",
  progress = TRUE
)
```

Arguments

cube	Classified image data cube.
memsize	maximum overall memory (in GB) to label the classification.
multicores	Number of workers to label the classification in parallel.
output_dir	Output directory for classified files.
version	Version of resulting image (in the case of multiple runs).
progress	Show progress bar?

Value

A data cube with an image with the classified map.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
  # create a random forest model
  rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # classify a data cube
  probs_cube <- sits_classify(
    data = cube, ml_model = rfor_model, output_dir = tempdir()
  )
  # plot the probability cube
  plot(probs_cube)
  # smooth the probability cube using Bayesian statistics
  bayes_cube <- sits_smooth(probs_cube, output_dir = tempdir())
  # plot the smoothed cube
  plot(bayes_cube)
  # label the probability cube
  label_cube <- sits_label_classification(
    bayes_cube, output_dir = tempdir()
  )
  # plot the labelled cube
  plot(label_cube)
}
```

sits_lighttae

Train a model using Lightweight Temporal Self-Attention Encoder

Description

Implementation of Light Temporal Attention Encoder (L-TAE) for satellite image time series

This function is based on the paper by Vivien Garnot referenced below and code available on github at <https://github.com/VSainteuf/lightweight-temporal-attention-pytorch> If you use this method, please cite the original TAE and the LTAE paper.

We also used the code made available by Maja Schneider in her work with Marco Körner referenced below and available at <https://github.com/maja601/RC2020-psetae>.

Usage

```
sits_lighttae(
  samples = NULL,
  samples_validation = NULL,
  epochs = 150,
  batch_size = 128,
  validation_split = 0.2,
  optimizer = torchopt::optim_adamw,
  opt_hparams = list(lr = 0.005, eps = 1e-08, weight_decay = 1e-06),
  lr_decay_epochs = 50,
  lr_decay_rate = 1,
  patience = 20,
  min_delta = 0.01,
  verbose = FALSE
)
```

Arguments

<code>samples</code>	Time series with the training samples.
<code>samples_validation</code>	Time series with the validation samples. if the <code>samples_validation</code> parameter is provided, the <code>validation_split</code> parameter is ignored.
<code>epochs</code>	Number of iterations to train the model.
<code>batch_size</code>	Number of samples per gradient update.
<code>validation_split</code>	Fraction of training data to be used as validation data.
<code>optimizer</code>	Optimizer function to be used.
<code>opt_hparams</code>	Hyperparameters for optimizer: <code>lr</code> : Learning rate of the optimizer <code>eps</code> : Term added to the denominator to improve numerical stability. <code>weight_decay</code> : L2 regularization
<code>lr_decay_epochs</code>	Number of epochs to reduce learning rate.
<code>lr_decay_rate</code>	Decay factor for reducing learning rate.
<code>patience</code>	Number of epochs without improvements until training stops.
<code>min_delta</code>	Minimum improvement in loss function to reset the patience counter.
<code>verbose</code>	Verbosity mode (TRUE/FALSE). Default is FALSE.

Value

A fitted model to be used for classification of data cubes.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

  )
  # plot the labelled cube
  plot(label_cube)
}
```

sits_merge	<i>Merge two data sets (time series or cubes)</i>
------------	---------------------------------------------------

Description

To merge two series, we consider that they contain different attributes but refer to the same data cube, and spatiotemporal location. This function is useful to merge different bands of the same locations. For example, one may want to put the raw and smoothed bands for the same set of locations in the same tibble.

To merge data cubes, they should share the same sensor, resolution, bounding box, timeline, and have different bands.

Usage

```
sits_merge(data1, data2, ..., suffix = c(".1", ".2"))

## S3 method for class 'sits'
sits_merge(data1, data2, ..., suffix = c(".1", ".2"))

## S3 method for class 'raster_cube'
sits_merge(data1, data2, ..., suffix = c(".1", ".2"))
```

Arguments

data1	Time series or cube to be merged.
data2	Time series or cube to be merged.
...	Additional parameters
suffix	If there are duplicate bands in data1 and data2 these suffixes will be added.

Value

merged data sets

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
  # Retrieve a time series with values of NDVI
  point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")

  # Filter the point using the Whittaker smoother
  point_whit <- sits_filter(point_ndvi, sits_whittaker(lambda = 3.0))
  # Merge time series
  point_ndvi <- sits_merge(point_ndvi, point_whit, suffix = c("", ".WHIT"))
}
```

```
    # Plot the two points to see the smoothing effect
    plot(point_ndvi)
  }
```

sits_mixture_model *Multiple endmember spectral mixture analysis*

Description

Create a multiple endmember spectral mixture analyses fractions images. We use the non-negative least squares (NNLS) solver to calculate the fractions of each endmember. The NNLS was implemented by Jakob Schwalb-Willmann in RStoolbox package (licensed as GPL \geq 3).

Usage

```
sits_mixture_model(
  data,
  endmembers,
  ...,
  rmse_band = TRUE,
  multicores = 2,
  progress = TRUE
)

## S3 method for class 'sits'
sits_mixture_model(
  data,
  endmembers,
  ...,
  rmse_band = TRUE,
  multicores = 2,
  progress = TRUE
)

## S3 method for class 'raster_cube'
sits_mixture_model(
  data,
  endmembers,
  ...,
  rmse_band = TRUE,
  memsize = 4,
  multicores = 2,
  output_dir,
  progress = TRUE
)
```

Arguments

data	A sits data cube or a sits tibble.
endmembers	Reference spectral endmembers. (see details below).
...	Parameters for specific functions.
rmse_band	A boolean indicating whether the error associated with the linear model should be generated. If true, a new band with errors for each pixel is generated using the root mean square measure (RMSE). Default is TRUE.
multicores	Number of cores to be used for generate the mixture model.
progress	Show progress bar? Default is TRUE.
memsizes	Memory available for the mixture model (in GB).
output_dir	Directory for output images.

Details

The endmembers parameter should be a tibble, csv or a shapefile. endmembers parameter must have the following columns: type, which defines the endmembers that will be created and the columns corresponding to the bands that will be used in the mixture model. The band values must follow the product scale. For example, in the case of sentinel-2 images the bands should be in the range 0 to 1. See the example in this documentation for more details.

Value

In case of a cube, a sits cube with the fractions of each endmember will be returned. The sum of all fractions is restricted to 1 (scaled from 0 to 10000), corresponding to the abundance of the endmembers in the pixels. In case of a tibble sits, the time series will be returned with the values corresponding to each fraction.

    "forest", 0.02, 0.0352, 0.0189, 0.28, 0.134, 0.0546,
    "land", 0.04, 0.065, 0.07, 0.36, 0.35, 0.18,
    "water", 0.07, 0.11, 0.14, 0.085, 0.004, 0.0026
  )

  # Generate the mixture model
  mm <- sits_mixture_model(
    data = reg_cube,
    endmembers = em,
    memsize = 4,
    multicores = 2,
    output_dir = tempdir()
  )
}

```

sits_mlp

Train multi-layer perceptron models using torch

Description

Use a multi-layer perceptron algorithm to classify data. This function uses the R "torch" and "luz" packages. Please refer to the documentation of those package for more details.

Usage

```

sits_mlp(
  samples = NULL,

```

```

samples_validation = NULL,
layers = c(512, 512, 512),
dropout_rates = c(0.2, 0.3, 0.4),
optimizer = torchopt::optim_adamw,
opt_hparams = list(lr = 0.001, eps = 1e-08, weight_decay = 1e-06),
epochs = 100,
batch_size = 64,
validation_split = 0.2,
patience = 20,
min_delta = 0.01,
verbose = FALSE
)

```

Arguments

<code>samples</code>	Time series with the training samples.
<code>samples_validation</code>	Time series with the validation samples. if the <code>samples_validation</code> parameter is provided, the <code>validation_split</code> parameter is ignored.
<code>layers</code>	Vector with number of hidden nodes in each layer.
<code>dropout_rates</code>	Vector with the dropout rates (0,1) for each layer.
<code>optimizer</code>	Optimizer function to be used.
<code>opt_hparams</code>	Hyperparameters for optimizer: <code>lr</code> : Learning rate of the optimizer <code>eps</code> : Term added to the denominator to improve numerical stability.. <code>weight_decay</code> : L2 regularization
<code>epochs</code>	Number of iterations to train the model.
<code>batch_size</code>	Number of samples per gradient update.
<code>validation_split</code>	Number between 0 and 1. Fraction of the training data for validation. The model will set apart this fraction and will evaluate the loss and any model metrics on this data at the end of each epoch.
<code>patience</code>	Number of epochs without improvements until training stops.
<code>min_delta</code>	Minimum improvement in loss function to reset the patience counter.
<code>verbose</code>	Verbosity mode (TRUE/FALSE). Default is FALSE.

Value

A torch mlp model to be used for classification.

Note

The parameters for the MLP have been chosen based on the work by Wang et al. 2017 that takes multilayer perceptrons as the baseline for time series classifications: (a) Three layers with 512 neurons each, specified by the parameter ‘layers’; (b) dropout rates of 10 (c) the "optimizer_adam" as optimizer (default value); (d) a number of training steps (‘epochs’) of 100; (e) a ‘batch_size’

of 64, which indicates how many time series are used for input at a given steps; (f) a validation percentage of 20 will be randomly set side for validation. (g) The "relu" activation function.

}
```

sits_model_export *Export classification models*

Description

Given a trained machine learning or deep learning model, exports the model as an object for further exploration outside the "sits" package

Usage

```
sits_model_export(ml_model)

## S3 method for class 'sits_model'
sits_model_export(ml_model)
```

Arguments

ml_model A trained machine learning model

Value

An R object containing the model in the original format of machine learning or deep learning package.

Rolf Simoes, <rolf.simoese@inpe.br>
Gilberto Camara, <gilberto.camara@inpe.br>

sits_mosaic *Mosaic classified cubes*

Description

Creates a mosaic of all tiles of a sits cube. Mosaics can be created from EO cubes and derived cubes. In sits EO cubes, the mosaic will be generated for each band and date. It is recommended to filter the image with the less cloud cover to create a mosaic for the EO cubes. It is possible to provide a roi to crop the mosaic.

Usage

```
sits_mosaic(
  cube,
  crs = "EPSG:3857",
  roi = NULL,
  multicores = 2,
  output_dir,
  version = "v1",
  progress = TRUE
)
```

Arguments

cube	A sits data cube.
crs	A target coordinate reference system of raster mosaic. The provided crs could be a string (e.g. "EPSG:4326" or a proj4string), or an EPSG code number (e.g. 4326). Default is "EPSG:3857" - WGS 84 / Pseudo-Mercator.
roi	Region of interest (see below).
multicores	Number of cores that will be used to crop the images in parallel.
output_dir	Directory for output images.
version	Version of resulting image (in the case of multiple tests)
progress	Show progress bar? Default is TRUE.

Value

a sits cube with only one tile.

Note

The "roi" parameter defines a region of interest. It can be an `sf_object`, a shapefile, or a bounding box vector with named XY values ("xmin", "xmax", "ymin", "ymax") or named lat/long values ("lon_min", "lat_min", "lon_max", "lat_max")

The user should specify the crs of the mosaic since in many cases the input images will be in different coordinate systems. For example, when mosaicking Sentinel-2 images the inputs will be in general in different UTM grid zones.

# label the probability cube
label_cube <- sits_label_classification(
  bayes_cube, output_dir = tempdir()
)
# create roi
roi <- sf::st_sfc(
  sf::st_polygon(
    list(rbind(
      c(-55.64768, -11.68649),
      c(-55.69654, -11.66455),
      c(-55.62973, -11.61519),
      c(-55.64768, -11.68649))))), crs = "EPSG:4326"
)
# crop and mosaic classified image
mosaic_cube <- sits_mosaic(
  cube = label_cube,
  roi = roi,
  crs = "EPSG:4326",
  output_dir = tempdir()
)
}

```

sits_patterns

Find temporal patterns associated to a set of time series

Description

This function takes a set of time series samples as input estimates a set of patterns. The patterns are calculated using a GAM model. The idea is to use a formula of type $y \sim s(x)$, where x is a temporal reference and y if the value of the signal. For each time, there will be as many predictions as there are sample values. The GAM model predicts a suitable approximation that fits the assumptions of the statistical model, based on a smooth function.

This method is based on the "createPatterns" method of the dtwSat package, which is also described in the reference paper.

Usage

```
sits_patterns(data = NULL, freq = 8, formula = y ~ s(x), ...)
```

Arguments

data	Time series.
freq	Interval in days for estimates.
formula	Formula to be applied in the estimate.
...	Any additional parameters.

Value

Time series with patterns.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Examples

```
if (sits_run_examples()) {  
  patterns <- sits_patterns(cerrado_2classes)  
  plot(patterns)  
}
```

sits_reclassify *Reclassify a classified cube*

Description

Apply a set of named expressions to reclassify a classified image. The expressions should use character values to refer to labels in logical expressions.

Usage

```
sits_reclassify(  
  cube,  
  mask,  
  rules,  
  memsize = 4,  
  multicores = 2,  
  output_dir,  
  version = "v1"  
)  
  
## S3 method for class 'class_cube'  
sits_reclassify(  
  cube,  
  mask,  
  rules,  
  memsize = 4,  
  multicores = 2,  
  output_dir,  
  version = "v1"  
)
```

Arguments

cube	Classified image cube to be reclassified.
mask	Classified image cube with additional information to be used in expressions.
rules	Named expressions to be evaluated (see details).
memsize	Memory available for classification (in GB).
multicores	Number of cores to be used for classification.
output_dir	Directory where files will be saved.
version	Version of resulting image (in the case of multiple runs).

Details

sits_reclassify() allow any valid R expression to compute reclassification. User should refer to cube and mask to construct logical expressions. Users can use any R expression that

evaluates to logical. TRUE values will be relabeled to expression name. Updates are done in asynchronous manner, that is, all expressions are evaluated using original classified values. Expressions are evaluated sequentially and resulting values are assigned to output cube. Last expressions has precedence over first ones.

Value

A classified image cube.

  version = "v2"
)

plot(ro_mask)
}

```

sits_reduce_imbalance *Reduce imbalance in a set of samples*

Description

Takes a sits tibble with different labels and returns a new tibble. Deals with class imbalance using the synthetic minority oversampling technique (SMOTE) for oversampling. Undersampling is done using the SOM methods available in the sits package.

Usage

```

sits_reduce_imbalance(
  samples,
  n_samples_over = 200,
  n_samples_under = 400,
  multicores = 2
)

```

Arguments

samples Sample set to rebalance

n_samples_over	Number of samples to oversample for classes with samples less than this number.
n_samples_under	Number of samples to undersample for classes with samples more than this number.
multicores	Number of cores to process the data (default 2).

Value

A sits tibble with reduced sample imbalance.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, [<gilberto.camara@inpe.br>](mailto:gilberto.camara@inpe.br)

References

The reference paper on SMOTE is N. V. Chawla, K. W. Bowyer, L. O'Hall, W. P. Kegelmeyer, "SMOTE: synthetic minority over-sampling technique," Journal of artificial intelligence research, 321-357, 2002.

Undersampling uses the SOM map developed by Lorena Santos and co-workers and used in the `sits_som_map()` function. The SOM map technique is described in the paper: Lorena Santos, Karine Ferreira, Gilberto Camara, Michelle Picoli, Rolf Simoes, "Quality control and class noise reduction of satellite image time series". ISPRS Journal of Photogrammetry and Remote Sensing, vol. 177, pp 75-88, 2021. <https://doi.org/10.1016/j.isprsjprs.2021.04.014>.

Examples

```
if (sits_run_examples()) {  
  # print the labels summary for a sample set  
  sits_labels_summary(samples_modis_ndvi)  
  # reduce the sample imbalance  
  new_samples <- sits_reduce_imbalance(samples_modis_ndvi,  
    n_samples_over = 200,  
    n_samples_under = 200,  
    multicores = 1  
  )  
  # print the labels summary for the rebalanced set  
  sits_labels_summary(new_samples)  
}
```

sits_regularize

Build a regular data cube from an irregular one

Description

Produces regular data cubes for analysis-ready data (ARD) image collections. Analysis-ready data (ARD) collections available in AWS, MPC, USGS and DEAfrica are not regular in space and time. Bands may have different resolutions, images may not cover the entire time, and time intervals are not regular. For this reason, subsets of these collection need to be converted to regular data cubes before further processing and data analysis.

This function requires users to include the cloud band in their ARD-based data cubes.

Usage

```
sits_regularize(
  cube,
  period,
  res,
  roi = NULL,
  multicores = 2,
  output_dir,
  progress = TRUE
)
```

Arguments

cube	raster_cube object whose observation period and/or spatial resolution is not constant.
period	ISO8601-compliant time period for regular data cubes, with number and unit, where "D", "M" and "Y" stand for days, month and year; e.g., "P16D" for 16 days.
res	Spatial resolution of regularized images (in meters).
roi	A named numeric vector with a region of interest. See more above.
multicores	Number of cores used for regularization; used for parallel processing of input.
output_dir	Valid directory for storing regularized images.
progress	show progress bar?

Value

A raster_cube object with aggregated images.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

The "roi" parameter defines a region of interest. It can be an sf_object, a shapefile, or a bounding box vector with named XY values ("xmin", "xmax", "ymin", "ymax") or named lat/long values ("lat_min", "lat_max", "long_min", "long_max"). The sits_regularize function will crop the images that contain the roi region.

The aggregation method used in sits_regularize sorts the images based on cloud cover, where images with the fewest clouds at the top of the stack. Once the stack of images is sorted, the method uses the first valid value to create the temporal aggregation.

The input (non-regular) ARD cube needs to include the cloud band for the regularization to work.

Examples

```
if (sits_run_examples()) {
  # define a non-regular Sentinel-2 cube in AWS
  s2_cube_open <- sits_cube(
    source = "AWS",
    collection = "SENTINEL-S2-L2A-COGS",
    tiles = c("20LKP", "20LLP"),
    bands = c("B8A", "SCL"),
    start_date = "2018-10-01",
    end_date = "2018-11-01"
  )
  # regularize the cube
  rg_cube <- sits_regularize(
    cube = s2_cube_open,
    output_dir = tempdir(),
    res = 60,
    period = "P16D",
    multicores = 2
  )
}
```

Description

Use a ResNet architecture for classifying image time series. The ResNet (or deep residual network) was proposed by a team in Microsoft Research for 2D image classification. ResNet tries to address the degradation of accuracy in a deep network. The idea is to replace a deep network with a combination of shallow ones. In the paper by Fawaz et al. (2019), ResNet was considered the best method for time series classification, using the UCR dataset. Please refer to the paper for more details.

The R-torch version is based on the code made available by Zhiguang Wang, author of the original paper. The code was developed in python using keras.

<https://github.com/cauchyturing> (repo: UCR_Time_Series_Classification_Deep_Learning_Baseline)

The R-torch version also considered the code by Ignacio Oguiza, whose implementation is available at <https://github.com/timeseriesAI/tsai/blob/main/tsai/models/ResNet.py>.

There are differences between Wang's Keras code and Oguiza torch code. In this case, we have used Wang's keras code as the main reference.

Usage

```
sits_resnet(
  samples = NULL,
  samples_validation = NULL,
  blocks = c(64, 128, 128),
  kernels = c(7, 5, 3),
  epochs = 100,
  batch_size = 64,
  validation_split = 0.2,
  optimizer = torchopt::optim_adamw,
  opt_hparams = list(lr = 0.001, eps = 1e-08, weight_decay = 1e-06),
  lr_decay_epochs = 1,
  lr_decay_rate = 0.95,
  patience = 20,
  min_delta = 0.01,
  verbose = FALSE
)
```

Arguments

<code>samples</code>	Time series with the training samples.
<code>samples_validation</code>	Time series with the validation samples. if the <code>samples_validation</code> parameter is provided, the <code>validation_split</code> parameter is ignored.
<code>blocks</code>	Number of 1D convolutional filters for each block of three layers.
<code>kernels</code>	Size of the 1D convolutional kernels
<code>epochs</code>	Number of iterations to train the model. for each layer of each block.
<code>batch_size</code>	Number of samples per gradient update.
<code>validation_split</code>	Fraction of training data to be used as validation data.

optimizer	Optimizer function to be used.
opt_hparams	Hyperparameters for optimizer: lr : Learning rate of the optimizer eps: Term added to the denominator to improve numerical stability. weight_decay: L2 regularization
lr_decay_epochs	Number of epochs to reduce learning rate.
lr_decay_rate	Decay factor for reducing learning rate.
patience	Number of epochs without improvements until training stops.
min_delta	Minimum improvement in loss function to reset the patience counter.
verbose	Verbosity mode (TRUE/FALSE). Default is FALSE.

Value

A fitted model to be used for classification.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

)
# plot the labelled cube
plot(label_cube)
}

```

sits_rfor

Train random forest models

Description

Use Random Forest algorithm to classify samples. This function is a front-end to the "randomForest" package. Please refer to the documentation in that package for more details.

Usage

```
sits_rfor(samples = NULL, num_trees = 120, mtry = NULL, ...)
```

Arguments

<code>samples</code>	Time series with the training samples.
<code>num_trees</code>	Number of trees to grow. This should not be set to too small a number, to ensure that every input row gets predicted at least a few times (default: 120).
<code>mtry</code>	Number of variables randomly sampled as candidates at each split (default: NULL - use default value of <code>randomForest::randomForest()</code> function, i.e. <code>floor(sqrt(features))</code>).
<code>...</code>	Other parameters to be passed to 'randomForest::randomForest' function.

Value

Model fitted to input data (to be passed to `sits_classify`).

Note

Please refer to the sits documentation available in [<https://e-sensing.github.io/sitsbook/>](https://e-sensing.github.io/sitsbook/) for detailed examples.

  # train a random forest model
  rf_model <- sits_train(samples_modis_ndvi,
                        ml_method = sits_rfor(mtry = 20))
  # classify the point
  point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
  # classify the point
  point_class <- sits_classify(
    data = point_ndvi, ml_model = rf_model
  )
  plot(point_class)
}
```

sits_run_examples *Informs if sits examples should run*

Description

This function informs if sits examples should run. To run the examples, set "SITS_RUN_EXAMPLES" environment variable to "YES" using `Sys.setenv("SITS_RUN_EXAMPLES" = "YES")`. To come back to the default behaviour, please unset the environment variable `Sys.unsetenv("SITS_RUN_EXAMPLES")`.

Usage

```
sits_run_examples()
```

Value

A logical value

sits_run_tests	<i>Informs if sits tests should run</i>
----------------	-----------------------------------------

Description

This function informs if sits examples should run. To run the examples, set "SITS_RUN_TESTS" environment variable to "YES" using `Sys.setenv("SITS_RUN_TESTS" = "YES")` To come back to the default behaviour, please unset the environment variable `Sys.unsetenv("SITS_RUN_TESTS")`

Usage

```
sits_run_tests()
```

Value

TRUE/FALSE

sits_sample	<i>Sample a percentage of a time series</i>
-------------	---------------------------------------------

Description

Takes a sits tibble with different labels and returns a new tibble. For a given field as a group criterion, this new tibble contains a given number or percentage of the total number of samples per group. Parameter n: number of random samples. Parameter frac: a fraction of random samples. If n is greater than the number of samples for a given label, that label will be sampled with replacement. Also, if $\text{frac} > 1$, all sampling will be done with replacement.

Usage

```
sits_sample(data, n = NULL, frac = NULL, oversample = TRUE)
```

Arguments

data	Input sits tibble.
n	Number of samples to pick from each group of data.
frac	Percentage of samples to pick from each group of data.
oversample	Oversample classes with small number of samples?

Value

A sits tibble with a fixed quantity of samples.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
# Retrieve a set of time series with 2 classes
data(cerrado_2classes)
# Print the labels of the resulting tibble
sits_labels(cerrado_2classes)
# Samples the data set
data <- sits_sample(cerrado_2classes, n = 10)
# Print the labels of the resulting tibble
sits_labels(data)
```

<code>sits_select</code>	<i>Filter bands on a data set (tibble or cube)</i>
--------------------------	----------------------------------------------------

Description

Filter only the selected bands from a tibble or a data cube.

Usage

```
sits_select(data, bands = NULL, start_date = NULL, end_date = NULL, ...)
```

```
## S3 method for class 'sits'
sits_select(data, bands = NULL, start_date = NULL, end_date = NULL, ...)
```

```
## S3 method for class 'raster_cube'
sits_select(
  data,
  bands = NULL,
  start_date = NULL,
  end_date = NULL,
  ...,
  tiles = NULL
)
```

```
## S3 method for class 'patterns'
sits_select(data, bands, ...)
```

Arguments

<code>data</code>	A sits tibble or data cube.
<code>bands</code>	Character vector with the names of the bands.
<code>start_date</code>	Character value with the start date to be filtered.
<code>end_date</code>	Character value with the end date to be filtered.
<code>...</code>	Additional parameters to be provided in the select function.
<code>tiles</code>	Character vector with the names of the tiles.

Value

For sits tibble, returns a sits tibble with the selected bands. For data cube, a data cube with the selected bands.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
# Retrieve a set of time series with 2 classes
data(cerrado_2classes)
# Print the original bands
sits_bands(cerrado_2classes)
# Select only the NDVI band
data <- sits_select(cerrado_2classes, bands = c("NDVI"))
# Print the labels of the resulting tibble
sits_bands(data)
```

sits_smooth

Smooth probability cubes with spatial predictors

Description

Takes a set of classified raster layers with probabilities, whose metadata is created by [sits_cube](#), and applies a Bayesian smoothing function.

Usage

```
sits_smooth(
  cube,
  window_size = 9,
  neigh_fraction = 0.5,
  smoothness = 10,
  min_samples = 25,
  memsize = 4,
  multicores = 2,
  output_dir,
  version = "v1"
)
```

Arguments

`cube` Probability data cube.
`window_size` Size of the neighborhood.
`neigh_fraction` Fraction of neighbors with highest probability to be used in Bayesian inference.

smoothness	Estimated variance of logit of class probabilities (Bayesian smoothing parameter). It can be either a vector or a scalar.
min_samples	Minimum number of samples to estimate normal probability distribution for Bayesian inference.
memsizes	Maximum overall memory (in GB) to run the smoothing.
multicores	Number of cores to run the smoothing function
output_dir	Output directory for image files
version	Version of resulting image (in the case of multiple tests)

Value

A data cube.

Note

Please refer to the sits documentation available in [<https://e-sensing.github.io/sitsbook/>](https://e-sensing.github.io/sitsbook/) for detailed examples.

Author(s)

Gilberto Camara, [<gilberto.camara@inpe.br>](mailto:gilberto.camara@inpe.br)

Rolf Simoes, [<rolf.simoes@inpe.br>](mailto:rolf.simoes@inpe.br)

Examples

```
if (sits_run_examples()) {
  # create a ResNet model
  torch_model <- sits_train(samples_modis_ndvi, sits_resnet(epochs = 20))
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # classify a data cube
  probs_cube <- sits_classify(
    data = cube, ml_model = torch_model, output_dir = tempdir()
  )
  # plot the probability cube
  plot(probs_cube)
  # smooth the probability cube using Bayesian statistics
  bayes_cube <- sits_smooth(probs_cube, output_dir = tempdir())
  # plot the smoothed cube
  plot(bayes_cube)
  # label the probability cube
  label_cube <- sits_label_classification(
    bayes_cube, output_dir = tempdir()
  )
}
```

```

)
# plot the labelled cube
plot(label_cube)
}

```

sits_som

Use SOM for quality analysis of time series samples

Description

These function use self-organized maps to perform quality analysis in satellite image time series

`sits_som_map()` creates a SOM map, where high-dimensional data is mapped into a two dimensional map, keeping the topological relations between data patterns. Each sample is assigned to a neuron, and neurons are placed in the grid based on similarity.

`sits_som_evaluate_cluster()` analyses the neurons of the SOM map, and builds clusters based on them. Each cluster is a neuron or a set of neuron categorized with same label. It produces a tibble with the percentage of mixture of classes in each cluster.

`sits_som_clean_samples()` evaluates the quality of the samples based on the results of the SOM map. The algorithm identifies noisy samples, using ‘prior_threshold’ for the prior probability and ‘posterior_threshold’ for the posterior probability. Each sample receives an evaluation tag, according to the following rule: (a) If the prior probability is < ‘prior_threshold’, the sample is tagged as "remove"; (b) If the prior probability is >= ‘prior_threshold’ and the posterior probability is >= ‘posterior_threshold’, the sample is tagged as "clean"; (c) If the prior probability is >= ‘posterior_threshold’ and the posterior probability is < ‘posterior_threshold’, the sample is tagged as "analyze" for further inspection. The user can define which tagged samples will be returned using the "keep" parameter, with the following options: "clean", "analyze", "remove".

Usage

```

sits_som_map(
  data,
  grid_xdim = 10,
  grid_ydim = 10,
  alpha = 1,
  rlen = 100,
  distance = "euclidean",
  som_radius = 2,
  mode = "online"
)

```

Arguments

<code>data</code>	A tibble with samples to be clustered.
<code>grid_xdim</code>	X dimension of the SOM grid (default = 25).
<code>grid_ydim</code>	Y dimension of the SOM grid.
<code>alpha</code>	Starting learning rate (decreases according to number of iterations).

rlen	Number of iterations to produce the SOM.
distance	The type of similarity measure (distance).
som_radius	Radius of SOM neighborhood.
mode	Type of learning algorithm (default = "online").

Value

sits_som_map() produces a list with three members: (1) the samples tibble, with one additional column indicating to which neuron each sample has been mapped; (2) the Kohonen map, used for plotting and cluster quality measures; (3) a tibble with the labelled neurons, where each class of each neuron is associated to two values: (a) the prior probability that this class belongs to a cluster based on the frequency of samples of this class allocated to the neuron; (b) the posterior probability that this class belongs to a cluster, using data for the neighbours on the SOM map.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Lorena Alves, <lorena.santos@inpe.br>

Karine Ferreira. <karine.ferreira@inpe.br>

References

Lorena Santos, Karine Ferreira, Gilberto Camara, Michelle Picoli, Rolf Simoes, "Quality control and class noise reduction of satellite image time series". ISPRS Journal of Photogrammetry and Remote Sensing, vol. 177, pp 75-88, 2021. <https://doi.org/10.1016/j.isprsjprs.2021.04.014>.

Examples

```
if (sits_run_examples()) {  
  # create a som map  
  som_map <- sits_som_map(samples_modis_ndvi)  
  # plot the som map  
  plot(som_map)  
  # evaluate the som map and create clusters  
  clusters_som <- sits_som_evaluate_cluster(som_map)  
  # plot the cluster evaluation  
  plot(clusters_som)  
  # clean the samples  
  new_samples <- sits_som_clean_samples(som_map)  
}
```

`sits_som_clean_samples`*Cleans the samples based on SOM map information*

Description

Cleans the samples based on SOM map information

Usage

```
sits_som_clean_samples(  
  som_map,  
  prior_threshold = 0.6,  
  posterior_threshold = 0.6,  
  keep = c("clean", "analyze")  
)
```

Arguments

<code>som_map</code>	Returned by <code>sits_som_map</code> .
<code>prior_threshold</code>	Threshold of conditional probability (frequency of samples assigned to the same SOM neuron).
<code>posterior_threshold</code>	Threshold of posterior probability (influenced by the SOM neighborhood).
<code>keep</code>	Which types of evaluation to be maintained in the data.

Value

tibble with an two additional columns. The first indicates if each sample is clean, should be analyzed or should be removed. The second is the posterior probability of the sample.

`sits_som_evaluate_cluster`*Evaluate cluster*

Description

`sits_som_evaluate_cluster()` produces a tibble with the clusters found by the SOM map. For each cluster, it provides the percentage of classes inside it.

Usage

```
sits_som_evaluate_cluster(som_map)
```

Arguments

som_map A SOM map produced by the som_map() function

Value

A tibble stating the purity for each cluster

sits_svm	<i>Train support vector machine models</i>
----------	--------------------------------------------

Description

This function receives a tibble with a set of attributes X for each observation Y. These attributes are the values of the time series for each band. The SVM algorithm is used for multiclass-classification. For this purpose, it uses the "one-against-one" approach, in which $k(k-1)/2$ binary classifiers are trained; the appropriate class is found by a voting scheme. This function is a front-end to the "svm" method in the "e1071" package. Please refer to the documentation in that package for more details.

Usage

```
sits_svm(
  samples = NULL,
  formula = sits_formula_linear(),
  scale = FALSE,
  cachesize = 1000,
  kernel = "radial",
  degree = 3,
  coef0 = 0,
  cost = 10,
  tolerance = 0.001,
  epsilon = 0.1,
  cross = 10,
  ...
)
```

Arguments

samples	Time series with the training samples.
formula	Symbolic description of the model to be fit. (default: sits_formula_linear).
scale	Logical vector indicating the variables to be scaled.
cachesize	Cache memory in MB (default = 1000).
kernel	Kernel used in training and predicting. options: "linear", "polynomial", "radial", "sigmoid" (default: "radial").
degree	Exponential of polynomial type kernel (default: 3).
coef0	Parameter needed for kernels of type polynomial and sigmoid (default: 0).

cost	Cost of constraints violation (default: 10).
tolerance	Tolerance of termination criterion (default: 0.001).
epsilon	Epsilon in the insensitive-loss function (default: 0.1).
cross	Number of cross validation folds applied to assess the quality of the model (default: 10).
...	Other parameters to be passed to <code>e1071::svm</code> function.

Value

Model fitted to input data (to be passed to `sits_classify`)

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Alexandre Ywata de Carvalho, <alexandre.ywata@ipea.gov.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {  
  # Example of training a model for time series classification  
  # Retrieve the samples for Mato Grosso  
  # train an SVM model  
  ml_model <- sits_train(samples_modis_ndvi, ml_method = sits_svm)  
  # classify the point  
  point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")  
  # classify the point  
  point_class <- sits_classify(  
    data = point_ndvi, ml_model = ml_model  
  )  
  plot(point_class)  
}
```

Description

Implementation of Temporal Attention Encoder (TAE) for satellite image time series classification.

This function is based on the paper by Vivien Garnot referenced below and code available on github at <https://github.com/VSainteuf/pytorch-psetae>.

We also used the code made available by Maja Schneider in her work with Marco Körner referenced below and available at <https://github.com/maja601/RC2020-psetae>.

If you use this method, please cite Garnot's and Schneider's work.

Usage

```
sits_tae(
    samples = NULL,
    samples_validation = NULL,
    epochs = 150,
    batch_size = 64,
    validation_split = 0.2,
    optimizer = torchopt::optim_adamw,
    opt_hparams = list(lr = 0.001, eps = 1e-08, weight_decay = 1e-06),
    lr_decay_epochs = 1,
    lr_decay_rate = 0.95,
    patience = 20,
    min_delta = 0.01,
    verbose = FALSE
)
```

Arguments

<code>samples</code>	Time series with the training samples.
<code>samples_validation</code>	Time series with the validation samples. if the <code>samples_validation</code> parameter is provided, the <code>validation_split</code> parameter is ignored.
<code>epochs</code>	Number of iterations to train the model.
<code>batch_size</code>	Number of samples per gradient update.
<code>validation_split</code>	Number between 0 and 1. Fraction of training data to be used as validation data.
<code>optimizer</code>	Optimizer function to be used.
<code>opt_hparams</code>	Hyperparameters for optimizer: <code>lr</code> : Learning rate of the optimizer <code>eps</code> : Term added to the denominator to improve numerical stability. <code>weight_decay</code> : L2 regularization
<code>lr_decay_epochs</code>	Number of epochs to reduce learning rate.
<code>lr_decay_rate</code>	Decay factor for reducing learning rate.
<code>patience</code>	Number of epochs without improvements until training stops.
<code>min_delta</code>	Minimum improvement to reset the patience counter.
<code>verbose</code>	Verbosity mode (TRUE/FALSE). Default is FALSE.

Value

A fitted model to be used for classification.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Examples

```
if (sits_run_examples()) {
  # create a TAE model
  torch_model <- sits_train(samples_modis_ndvi, sits_tae())
  # plot the model
  plot(torch_model)
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # classify a data cube
  probs_cube <- sits_classify(
    data = cube, ml_model = torch_model, output_dir = tempdir()
  )
  # plot the probability cube
  plot(probs_cube)
  # smooth the probability cube using Bayesian statistics
  bayes_cube <- sits_smooth(probs_cube, output_dir = tempdir())
  # plot the smoothed cube
  plot(bayes_cube)
  # label the probability cube
  label_cube <- sits_label_classification(
```

```

        bayes_cube, output_dir = tempdir()
    )
    # plot the labelled cube
    plot(label_cube)
}

```

sits_tempcnn

Train temporal convolutional neural network models

Description

Use a TempCNN algorithm to classify data, which has two stages: a 1D CNN and a multi-layer perceptron. Users can define the depth of the 1D network, as well as the number of perceptron layers.

This function is based on the paper by Charlotte Pelletier referenced below. If you use this method, please cite the original tempCNN paper.

The torch version is based on the code made available by the BreizhCrops team: Marc Russwurm, Charlotte Pelletier, Marco Korner, Maximilian Zollner. The original python code is available at the website <https://github.com/dl4sits/BreizhCrops>. This code is licensed as GPL-3.

Usage

```

sits_tempcnn(
  samples = NULL,
  samples_validation = NULL,
  cnn_layers = c(128, 128, 128),
  cnn_kernels = c(7, 7, 7),
  cnn_dropout_rates = c(0.2, 0.2, 0.2),
  dense_layer_nodes = 256,
  dense_layer_dropout_rate = 0.5,
  epochs = 150,
  batch_size = 64,
  validation_split = 0.2,
  optimizer = torchopt::optim_adamw,
  opt_hparams = list(lr = 0.005, eps = 1e-08, weight_decay = 1e-06),
  lr_decay_epochs = 1,
  lr_decay_rate = 0.95,
  patience = 20,
  min_delta = 0.01,
  verbose = FALSE
)

```

Arguments

`samples` Time series with the training samples.

<code>samples_validation</code>	Time series with the validation samples. if the <code>samples_validation</code> parameter is provided, the <code>validation_split</code> parameter is ignored.
<code>cnn_layers</code>	Number of 1D convolutional filters per layer
<code>cnn_kernels</code>	Size of the 1D convolutional kernels.
<code>cnn_dropout_rates</code>	Dropout rates for 1D convolutional filters.
<code>dense_layer_nodes</code>	Number of nodes in the dense layer.
<code>dense_layer_dropout_rate</code>	Dropout rate (0,1) for the dense layer.
<code>epochs</code>	Number of iterations to train the model.
<code>batch_size</code>	Number of samples per gradient update.
<code>validation_split</code>	Fraction of training data to be used for validation.
<code>optimizer</code>	Optimizer function to be used.
<code>opt_hparams</code>	Hyperparameters for optimizer: <code>lr</code> : Learning rate of the optimizer <code>eps</code> : Term added to the denominator to improve numerical stability. <code>weight_decay</code> : L2 regularization
<code>lr_decay_epochs</code>	Number of epochs to reduce learning rate.
<code>lr_decay_rate</code>	Decay factor for reducing learning rate.
<code>patience</code>	Number of epochs without improvements until training stops.
<code>min_delta</code>	Minimum improvement in loss function to reset the patience counter.
<code>verbose</code>	Verbosity mode (TRUE/FALSE). Default is FALSE.

Value

A fitted model to be used for classification.

Note

Please refer to the sits documentation available in [<https://e-sensing.github.io/sitsbook/>](https://e-sensing.github.io/sitsbook/) for detailed examples.

    bayes_cube, output_dir = tempdir()
  )
  # plot the labelled cube
  plot(label_cube)
}
```

sits_timeline

Get timeline of a cube or a set of time series

Description

This function returns the timeline for a given data set, either a set of time series, a data cube, or a trained model.

Usage

```
sits_timeline(data)
```

Arguments

data either a sits tibble, a data cube, or a trained model.

Value

Timeline of sample set or of data cube.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
sits_timeline(samples_modis_ndvi)
```

sits_to_csv *Export a sits tibble metadata to the CSV format*

Description

Converts metadata from a sits tibble to a CSV file. The CSV file will not contain the actual time series. Its columns will be the same as those of a CSV file used to retrieve data from ground information ("latitude", "longitude", "start_date", "end_date", "cube", "label").

Usage

```
sits_to_csv(data, file)
```

Arguments

data Time series.
file Name of the exported CSV file.

Value

No return value, called for side effects.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
csv_file <- paste0(tempdir(), "/cerrado_2classes.csv")  
sits_to_csv(cerrado_2classes, file = csv_file)
```

`sits_to_xlsx`*Save accuracy assessments as Excel files*

Description

Saves confusion matrices as Excel spreadsheets. This function takes the a list of accuracy assessments generated by `sits_accuracy` and saves them in an Excel spreadsheet.

Usage

```
sits_to_xlsx(acc_lst, file, data = NULL)
```

Arguments

<code>acc_lst</code>	A list of accuracy statistics
<code>file</code>	The file where the XLSX data is to be saved.
<code>data</code>	(optional) Print information about the samples

Value

No return value, called for side effects.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
  # A dataset containing a tibble with time series samples
  # for the Mato Grosso state in Brasil
  # create a list to store the results
  results <- list()

  # accuracy assessment lightTAE
  acc_ltae <- sits_kfold_validate(samples_modis_ndvi,
    folds = 5,
    multicores = 1,
    ml_method = sits_lighttae()
  )
  # use a name
  acc_ltae$name <- "LightTAE"
```

```

# put the result in a list
results[[length(results) + 1]] <- acc_ltae

# save to xlsx file
sits_to_xlsx(
  results,
  file = tempfile("accuracy_mato_grosso_dl_", fileext = ".xlsx")
)
}

```

sits_train

Train classification models

Description

Given a tibble with a set of distance measures, returns trained models. Currently, sits supports the following models: 'svm' (see [sits_svm](#)), random forests (see [sits_rfor](#)), extreme gradient boosting (see [sits_xgboost](#)), and different deep learning functions, including multi-layer perceptrons (see [sits_mlp](#)), 1D convolution neural networks [sits_tempcnn](#), deep residual networks [sits_resnet](#) and self-attention encoders [sits_lighttae](#)

Usage

```
sits_train(samples, ml_method = sits_svm())
```

Arguments

samples	Time series with the training samples.
ml_method	Machine learning method.

Value

Model fitted to input data to be passed to [sits_classify](#)

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Alexandre Ywata de Carvalho, <alexandre.ywata@ipea.gov.br>

Examples

```

if (sits_run_examples()) {
# Retrieve the set of samples for Mato Grosso (provided by EMBRAPA)
# fit a training model (RFOR model)
ml_model <- sits_train(samples_modis_ndvi, sits_rfor(num_trees = 50))
# get a point and classify the point with the ml_model
point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
}

```

```

class <- sits_classify(
  data = point_ndvi, ml_model = ml_model
)
}

```

sits_tuning

*Tuning machine learning models hyper-parameters***Description**

Machine learning models use stochastic gradient descent (SGD) techniques to find optimal solutions. To perform SGD, models use optimization algorithms which have hyperparameters that have to be adjusted to achieve best performance for each application.

This function performs a random search on values of selected hyperparameters. Instead of performing an exhaustive test of all parameter combinations, it selecting them randomly. Validation is done using an independent set of samples or by a validation split. The function returns the best hyper-parameters in a list.

hyper-parameters passed to params parameter should be passed by calling `sits_tuning_hparams()` function.

Usage

```

sits_tuning(
  samples,
  samples_validation = NULL,
  validation_split = 0.2,
  ml_method = sits_tempcnn(),
  params = sits_tuning_hparams(optimizer = torchopt::optim_adamw, opt_hparams = list(lr =
    beta(0.3, 5))),
  trials = 30,
  multicores = 2,
  progress = FALSE
)

```

Arguments

<code>samples</code>	Time series set to be validated.
<code>samples_validation</code>	Time series set used for validation.
<code>validation_split</code>	Percent of original time series set to be used for validation (if <code>samples_validation</code> is NULL)
<code>ml_method</code>	Machine learning method.
<code>params</code>	List with hyper parameters to be passed to <code>ml_method</code> . User can use <code>uniform</code> , <code>choice</code> , <code>randint</code> , <code>normal</code> , <code>lognormal</code> , <code>loguniform</code> , and <code>beta</code> distribution functions to randomize parameters.

trials	Number of random trials to perform the random search.
multicores	Number of cores to process in parallel
progress	Show progress bar?

Value

A tibble containing all parameters used to train on each trial ordered by accuracy

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

References

James Bergstra, Yoshua Bengio, "Random Search for Hyper-Parameter Optimization". Journal of Machine Learning Research. 13: 281–305, 2012.

Examples

```
if (sits_run_examples()) {
  # find best learning rate parameters for TempCNN
  tuned <- sits_tuning(
    samples_modis_ndvi,
    ml_method = sits_tempcnn(),
    params = sits_tuning_hparams(
      optimizer = choice(
        torchopt::optim_adamw
      ),
      opt_hparams = list(
        lr = beta(0.3, 5)
      )
    ),
    trials = 4,
    multicores = 2,
    progress = FALSE
  )
  # obtain best accuracy, kappa and best_lr
  accuracy <- tuned$accuracy[[1]]
  kappa <- tuned$kappa[[1]]
  best_lr <- tuned$opt_hparams[[1]]$lr
}
```

sits_tuning_hparams *Tuning machine learning models hyper-parameters*

Description

This function allow user building the hyper-parameters space used by `sits_tuning()` function search randomly the best parameter combination.

User should pass the possible values for hyper-parameters as constant or by calling the following random functions:

- `uniform(min = 0, max = 1, n = 1)`: returns random numbers from a uniform distribution with parameters `min` and `max`.
- `choice(..., replace = TRUE, n = 1)`: returns random objects passed to `...` with replacement or not (parameter `replace`).
- `randint(min, max, n = 1)`: returns random integers from a uniform distribution with parameters `min` and `max`.
- `normal(mean = 0, sd = 1, n = 1)`: returns random numbers from a normal distribution with parameters `min` and `max`.
- `lognormal(meanlog = 0, sdlog = 1, n = 1)`: returns random numbers from a lognormal distribution with parameters `min` and `max`.
- `loguniform(minlog = 0, maxlog = 1, n = 1)`: returns random numbers from a loguniform distribution with parameters `min` and `max`.
- `beta(shape1, shape2, n = 1)`: returns random numbers from a beta distribution with parameters `min` and `max`.

These functions accepts `n` parameter to indicate how many values should be returned.

Usage

```
sits_tuning_hparams(...)
```

Arguments

... Used to prepare hyper-parameter space

Value

A list containing the hyper-parameter space to be passed to `sits_tuning()`'s `params` parameter.

Examples

```
if (sits_run_examples()) {  
  # find best learning rate parameters for TempCNN  
  tuned <- sits_tuning(  
    samples_modis_ndvi,  
    ml_method = sits_tempcnn(),  
  )  
}
```

```

        params = sits_tuning_hparams(
            optimizer = choice(
                torchopt::optim_adamw,
                torchopt::optim_yogi
            ),
            opt_hparams = list(
                lr = beta(0.3, 5)
            )
        ),
        trials = 4,
        multicores = 2,
        progress = FALSE
    )
}

```

sits_uncertainty

Estimate classification uncertainty based on probs cube

Description

Calculate the uncertainty cube based on the probabilities produced by the classifier. Takes a probability cube as input. The uncertainty measure is relevant in the context of active learning, and helps to increase the quantity and quality of training samples by providing information about the confidence of the model. The supported types of uncertainty are 'entropy', 'least', and 'margin'. 'entropy' is the difference between all predictions expressed as entropy, 'least' is the difference between 100 prediction, and 'margin' is the difference between the two most confident predictions.

Usage

```

sits_uncertainty(
  cube,
  type = "entropy",
  multicores = 2,
  memsize = 4,
  output_dir,
  version = "v1"
)

## S3 method for class 'least'
sits_uncertainty(
  cube,
  type = "least",
  multicores = 2,
  memsize = 4,
  output_dir,
  version = "v1"
)

```

```
## S3 method for class 'entropy'  
sits_uncertainty(  
  cube,  
  type = "entropy",  
  multicores = 2,  
  memsize = 4,  
  output_dir,  
  version = "v1"  
)  
  
## S3 method for class 'margin'  
sits_uncertainty(  
  cube,  
  type = "margin",  
  multicores = 2,  
  memsize = 4,  
  output_dir,  
  version = "v1"  
)
```

Arguments

cube	Probability data cube.
type	Method to measure uncertainty. See details.
multicores	Number of cores to run the function.
memsize	Maximum overall memory (in GB) to run the function.
output_dir	Output directory for image files.
version	Version of resulting image (in the case of multiple tests).

Value

An uncertainty data cube

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

References

Monarch, Robert Munro. Human-in-the-Loop Machine Learning: Active learning and annotation for human-centered AI. Simon and Schuster, 2021.

Examples

```
if (sits_run_examples()) {
  # create a random forest model
  rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # classify a data cube
  probs_cube <- sits_classify(
    data = cube, ml_model = rfor_model, output_dir = tempdir()
  )
  # calculate uncertainty
  uncert_cube <- sits_uncertainty(probs_cube, output_dir = tempdir())
  # plot the resulting uncertainty cube
  plot(uncert_cube)
}
```

sits_uncertainty_sampling

Suggest samples for enhancing classification accuracy

Description

Suggest samples for regions of high uncertainty as predicted by the model. The function selects data points that have confused an algorithm. These points don't have labels and need be manually labelled by experts and then used to increase the classification's training set.

This function is best used in the following context

- 1. Select an initial set of samples.
- 2. Train a machine learning model.
- 3. Build a data cube and classify it using the model.
- 4. Run a Bayesian smoothing in the resulting probability cube.
- 5. Create an uncertainty cube.
- 6. Perform uncertainty sampling.

The Bayesian smoothing procedure will reduce the classification outliers and thus increase the likelihood that the resulting pixels with high uncertainty have meaningful information.

Usage

```
sits_uncertainty_sampling(  
  uncert_cube,  
  n = 100,  
  min_uncert = 0.4,  
  sampling_window = 10  
)
```

Arguments

<code>uncert_cube</code>	An uncertainty cube. See <code>sits_uncertainty</code> .
<code>n</code>	Number of suggested points.
<code>min_uncert</code>	Minimum uncertainty value to select a sample.
<code>sampling_window</code>	Window size for collecting points (in pixels). The minimum window size is 10.

Value

A tibble with longitude and latitude in WGS84 with locations which have high uncertainty and meet the minimum distance criteria.

Examples

```
if (sits_run_examples()) {  
  # create a data cube  
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")  
  cube <- sits_cube(  
    source = "BDC",  
    collection = "MOD13Q1-6",  
    data_dir = data_dir,  
    delim = "_",  
    parse_info = c("X1", "tile", "band", "date")  
  )  
  # build a random forest model  
  rfor_model <- sits_train(samples_modis_ndvi, ml_method = sits_rfor())  
  # classify the cube
```

```

probs_cube <- sits_classify(
  data = cube, ml_model = rfor_model, output_dir = tempdir()
)
# create an uncertainty cube
uncert_cube <- sits_uncertainty(probs_cube,
  type = "entropy",
  output_dir = tempdir())
# obtain a new set of samples for active learning
# the samples are located in uncertain places
new_samples <- sits_uncertainty_sampling(
  uncert_cube, n = 10, min_uncert = 0.4)
}

```

sits_validate

Validate time series samples

Description

One round of cross-validation involves partitioning a sample of data into complementary subsets, performing the analysis on one subset (called the training set), and validating the analysis on the other subset (called the validation set or testing set).

The function takes two arguments: a set of time series with a machine learning model and another set with validation samples. If the validation sample set is not provided, The sample dataset is split into two parts, as defined by the parameter `validation_split`. The accuracy is determined by the result of the validation test set.

This function returns the confusion matrix, and Kappa values.

Usage

```

sits_validate(
  samples,
  samples_validation = NULL,
  validation_split = 0.2,
  ml_method = sits_rfor()
)

```

Arguments

<code>samples</code>	Time series set to be validated.
<code>samples_validation</code>	Time series set used for validation.
<code>validation_split</code>	Percent of original time series set to be used for validation (if <code>samples_validation</code> is NULL)
<code>ml_method</code>	Machine learning method.

Value

A `caret::confusionMatrix` object to be used for validation assessment.

Author(s)

Rolf Simoes, <rolf.simoese@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()){  
  conf_matrix <- sits_validate(cerrado_2classes)  
}
```

sits_values	<i>Return the values of a set of time series</i>
-------------	--------------------------------------------------

Description

This function returns the values of a sits tibble (according a specified format). This function is useful to use packages such as `ggplot2`, `dtwclust`, or `kohonen` that require values that are rowwise or colwise organized.

Usage

```
sits_values(data, bands = NULL, format = "cases_dates_bands")
```

Arguments

data	A sits tibble with time series for different bands.
bands	Bands whose values are to be extracted.
format	A string with either "cases_dates_bands" or "bands_cases_dates" or "bands_dates_cases".

Value

A matrix with values.

Author(s)

Rolf Simoes, <rolf.simoese@inpe.br>

Examples

```
# Retrieve a set of time series with 2 classes
data(cerrado_2classes)
# retrieve the values split by bands and dates
ls1 <- sits_values(cerrado_2classes[1:2, ], format = "bands_dates_cases")
# retrieve the values split by cases (occurrences)
ls2 <- sits_values(cerrado_2classes[1:2, ], format = "cases_dates_bands")
#' # retrieve the values split by bands and cases (occurrences)
ls3 <- sits_values(cerrado_2classes[1:2, ], format = "bands_cases_dates")
```

sits_variance

*Calculate the variance of a probability cube***Description**

Takes a probability cube and estimate the local variance of the logit of the probability, to support the choice of parameters for Bayesian smoothing.

Usage

```
sits_variance(
  cube,
  window_size = 9,
  neigh_fraction = 0.5,
  multicores = 2,
  memsize = 4,
  output_dir,
  version = "v1"
)
```

Arguments

cube	Probability data cube.
window_size	Size of the neighborhood.
neigh_fraction	Fraction of neighbors with highest probability to be used in Bayesian inference.
multicores	Number of cores to run the smoothing function
memsize	Maximum overall memory (in GB) to run the smoothing.
output_dir	Output directory for image files
version	Version of resulting image (in the case of multiple tests)

Value

A variance data cube.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
  # create a ResNet model
  rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
  # create a data cube from local files
  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
  cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    delim = "_",
    parse_info = c("X1", "tile", "band", "date")
  )
  # classify a data cube
  probs_cube <- sits_classify(
    data = cube, ml_model = rfor_model, output_dir = tempdir()
  )
  # plot the probability cube
  plot(probs_cube)
  # smooth the probability cube using Bayesian statistics
  var_cube <- sits_variance(probs_cube, output_dir = tempdir())
  # plot the variance cube
  plot(var_cube)
}
```

sits_view

View data cubes and samples in leaflet

Description

Uses leaflet to visualize time series, raster cube and classified images

Usage

```
sits_view(x, ...)
```

```
## S3 method for class 'sits'
```

```
sits_view(x, ..., legend = NULL, palette = "Harmonic")
```

```

## S3 method for class 'som_map'
sits_view(
  x,
  ...,
  label,
  prob_max = 1,
  prob_min = 0.7,
  legend = NULL,
  palette = "Harmonic"
)

## S3 method for class 'raster_cube'
sits_view(
  x,
  ...,
  band = NULL,
  red = NULL,
  green = NULL,
  blue = NULL,
  tiles = x$tile,
  dates = sits_timeline(x[1, ])[1],
  class_cube = NULL,
  legend = NULL,
  palette = "default"
)

## S3 method for class 'class_cube'
sits_view(x, ..., tiles = NULL, legend = NULL, palette = "default")

## S3 method for class 'probs_cube'
sits_view(x, ...)

## Default S3 method:
sits_view(x, ...)

```

Arguments

x	Object of class "sits", "raster_cube" or "classified image".
...	Further specifications for sits_view .
legend	Named vector that associates labels to colors.
palette	Palette provided in the configuration file.
label	Label from the SOM map to be shown.
prob_max	Maximum a posteriori probability for SOM neuron samples to be shown
prob_min	Minimum a posteriori probability for SOM neuron samples to be shown
band	For plotting grey images.

red	Band for red color.
green	Band for green color.
blue	Band for blue color.
tiles	Tiles to be plotted (in case of a multi-tile cube).
dates	Dates to be plotted.
class_cube	Classified cube to be overlaid on top on image.

Value

A leaflet object containing either samples or data cubes embedded in a global map that can be visualized directly in an RStudio viewer.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
  sits_view(cerrado_2classes)

  data_dir <- system.file("extdata/raster/mod13q1", package = "sits")

  modis_cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6",
    data_dir = data_dir,
    parse_info = c("X1", "tile", "band", "date")
  )
  # view the data cube
  sits_view(modis_cube,
    band = "NDVI"
  )
  # train a model
  rf_model <- sits_train(samples_modis_ndvi, sits_rfor())

  modis_probs <- sits_classify(
    data = modis_cube,
    ml_model = rf_model,
    output_dir = tempdir(),
  )
  modis_label <- sits_label_classification(
    modis_probs, output_dir = tempdir()
  )
}
```

```

sits_view(modis_label)

sits_view(modis_cube,
          band = "NDVI",
          class_cube = modis_label,
          dates = sits_timeline(modis_cube)[[1]])
}

```

sits_xgboost

Train extreme gradient boosting models

Description

This function uses the extreme gradient boosting algorithm. Boosting iteratively adds basis functions in a greedy fashion so that each new basis function further reduces the selected loss function. This function is a front-end to the methods in the "xgboost" package. Please refer to the documentation in that package for more details.

Usage

```

sits_xgboost(
  samples = NULL,
  learning_rate = 0.15,
  min_split_loss = 1,
  max_depth = 5,
  min_child_weight = 1,
  max_delta_step = 1,
  subsample = 0.8,
  nfold = 5,
  nrounds = 100,
  early_stopping_rounds = 20,
  verbose = FALSE
)

```

Arguments

<code>samples</code>	Time series with the training samples.
<code>learning_rate</code>	Learning rate: scale the contribution of each tree by a factor of $0 < lr < 1$ when it is added to the current approximation. Used to prevent overfitting. Default: 0.15
<code>min_split_loss</code>	Minimum loss reduction to make a further partition of a leaf. Default: 1.
<code>max_depth</code>	Maximum depth of a tree. Increasing this value makes the model more complex and more likely to overfit. Default: 5.
<code>min_child_weight</code>	If the leaf node has a minimum sum of instance weights lower than <code>min_child_weight</code> , tree splitting stops. The larger <code>min_child_weight</code> is, the more conservative the algorithm is. Default: 1.

max_delta_step	Maximum delta step we allow each leaf output to be. If the value is set to 0, there is no constraint. If it is set to a positive value, it can help making the update step more conservative. Default: 1.
subsample	Percentage of samples supplied to a tree. Default: 0.8.
nfold	Number of the subsamples for the cross-validation.
nrounds	Number of rounds to iterate the cross-validation (default: 100)
early_stopping_rounds	Training with a validation set will stop if the performance doesn't improve for k rounds.
verbose	Print information on statistics during the process

Value

Model fitted to input data (to be passed to `sits_classify`)

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Examples

```
if (sits_run_examples()) {
  # Example of training a model for time series classification
  # Retrieve the samples for Mato Grosso
  # train a xgboost model
  ml_model <- sits_train(samples_modis_ndvi, ml_method = sits_xgboost)
  # classify the point
  point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
  # classify the point
  point_class <- sits_classify(
    data = point_ndvi, ml_model = ml_model
  )
  plot(point_class)
}
```

`%>%`*Pipe*

Description

Magrittr compound assignment pipe-operator.

Arguments

lhs, rhs A visualization and a function to apply to it.

Value

Apply lhs as input to rhs function

`'sits_labels<-'`*Change the labels of a set of time series*

Description

Given a sits tibble with a set of labels, renames the labels to the specified in value.

Usage

```
sits_labels(data) <- value

## S3 replacement method for class 'sits'
sits_labels(data) <- value

## S3 replacement method for class 'probs_cube'
sits_labels(data) <- value

## S3 replacement method for class 'class_cube'
sits_labels(data) <- value
```

Arguments

data Data cube or time series.
value A character vector used to convert labels. Labels will be renamed to the respective value positioned at the labels order returned by [sits_labels](#).

Value

A sits tibble with modified labels.
A sits tibble with modified labels.
A probs or class_cube cube with modified labels.
A probs cube with modified labels.

```
'sits_labels<-'
```
